Circled asterisk items identify major violation(s) of 329 IAC 2 or IC 13-7 and shall be corrected immediately

Comments: #10 - The waste has been ~~to the~~ worked on the top of a slope. Equipment cannot be worked on the entire length of the slope.

#12 - Because the waste has been worked on top of a slope weekly covers cannot be applied or has not been applied. There are areas which are snow covered which have not been covered. The bottom of the tunnel is filled with water and ice. The water and ice need to be removed before the waste can be worked.

The metal salvage pile has been cleaned up, however there are some telephone poles and guard rails stockpiled.

Check with our office if the new ~~SW~~ state SO applies to this site.

Comments: #6 – The scrap metal on site needs to be stored in transportable containers or in a building, not on the ground.

#10 – The waste is currently being dumped and pushed in a cliff. The waste needs to be worked on a slope which equipment currently does. The cover material cannot be placed on a steep cliff.

Brown or blackish discolored water is still seeping up from the bottom of the trench. In the area where the tree stumps were buried. I would recommend that clay be worked to seal the seeps.

SPECIAL WASTE

36. SPECIAL WASTE DISPOSAL, 2-21-15 *

Circled asterisk items identify major violation(s) of 329 IAC 2 or IC 13-7 and shall be corrected immediately

Comments: #10 — Waste which was deposited earlier has been worked in a "cliff" fashion. The face of the cliff is about 25 feet. Waste needs to be worked in a gentler slope.
#26 — Under the last Agreed Order, all waste is to be covered weekly. Because the waste was worked in a "cliff", weekly cover could not be applied to the face of the cliff. Check the Construction Plans for the thickness of the lift. A 25 foot lift is probably too much.
The area where a hole was being dug, into the groundwater, to place tree stumps has been covered. However there are several springs or seeps from the

RECEIVED BY: E Feddeler

Rev 2/90

bottom where the groundwater is coming up.

I would ~~[illegible]~~ recommend that sufficient clay be packed on the bottom to seal the groundwater weeps. Also, much of the groundwater weeping is discolored a dark brown or black. This should probable be considered a leachate.

#6 – The scrap metal and other salvaged materials need to be stored in containers or in a building, not on the ground.

Comments: #10 – The waste which was covered last week was worked at the steep of a slope to receive good compaction. I like to see waste and cover worked at a slope which I can walk.

A hole was being dug in the bottom of the trench to place stumps. Tree stumps are an excellent waste however I would prefer that the stumps be mixed with the whole insulation and covered rather than digging a hole deeper than the groundwater table to place the stumps. The hole was being dug with a dragline and was water filled.

Comments: There are a few seeps along the base of the filled area where a liquid which is discolored are draining into the bottom of the hole. The liquid has the appearance of leachate but it is unknown if it is coming from the waste or is just from the soil. Either way, it should be sealed off and other measures should be taken to prevent any off site migration. The area near the standpipe wells should be cleaned up by the drums at entrance.

Comments #10 - The west and the outside slopes need to be worked at a slope which a piece of equipment can run. Because of the present steepness, lower weeds may and vegetation has had time of establishing itself on the outside slopes. Because of the steepness while the west is worked cover material cannot be compacted over the entire slope.

The facility is now keeping statements of Origin manifests coming into the site.

31. SPECIAL WASTE, 2-19-5
32. RECORDS & REPORTS, 2-19-6
33. PERMIT DEVIATION/MODIFICATION, 2-8-11 *

INCINERATORS

34. OPERATIONAL REQUIREMENTS, 2-20-3
35. ADDITIONAL OPERATIONAL REQUIREMENTS & INFECTIOUS WASTE, 2-20-4

SPECIAL WASTE

36. SPECIAL WASTE DISPOSAL, 2-21-15 *

Circled asterisk items identify major violation(s) of 329 IAC 2 or IC 13-7 and shall be corrected immediately

Comments: The waste has recently been pushed and compacted. Additional clay cover needs to be applied to exposed waste. The steep which runs along the wall where cover material is stored, needs cover. The reason for need additional clay. The permit requires that all waste be covered weekly and cover material be maintained.
There may have been a change in the material used at Hobe. Some of the fines have emplished and the colors stains the water in the bottom of the lake.

RECEIVED BY: left copy of report at office

ACCEPTABLE (UNACCEPTABLE)

COMMENTS: #32 - As of September 1, 1989, a post-closure financial package and closure plan were to be submitted. We have yet to receive this information.
#16 - In the Agreed Order, which is still acting as your Operating Permit, weekly cover must be applied to all exposed waste. The corner of the fill, along the railroad tracks, has waste

RECEIVED BY:

Rev 9/89

no one at site or in office. left copy of report on desk in office

exposed through the cover. The waste was also not compacted down on a slope, but rather left in a cliff fashion and cover was pushed over the cliff. "Shingle punchouts" are being stored for roof material. Shingle material is considered a waste and needs to be covered.

#17 – When the wind blows, the fines from the "stock-condenser" are being blown. The stock-condenser fines need to go to a landfill when daily cover is applied.

A ditch has been dug in the bottom of the new trench. There are two springs flowing from the bottom of the newly excavated ditch. Took ~~the~~ three photographs of the site.

*Circled asterisk violations require immediate correction and results in an unacceptable rating.

COMMENTS: No violations were cited on the 6-27-89 inspection. #16 - All landfill equipment is to be equipped with roll bars and fire extinguishers. There was one dozer without a roll bar. ~~and no fire extinguisher~~. Cover material was being excavated during the inspection.

The new trench has been excavated to the depth of the water in the perimeter ditch. A small ~~ditch~~ ditch was cut in the dike (which separates the waste from the perimeter ditch) to drain the water in the new trench.

*Circled asterisk violations require immediate correction and results in an unacceptable rating.

COMMENTS: On the 5-31-89 inspection #5 was circled. There is a large amount of insulation visible. This will need to be composted on a slope and covered with clay soil within the week. Insulation waste has also been worked in a low area, next to the road where water was trapped. This too will need to be covered within the week.

329 IAC 2-14-6 requires that salvaged materials be stored in containers or ~~[illegible]~~ in a building, not on the ground. There is some scrap metal on the ground. It is not a major problem, but looks messy.

***Circled asterisk violations require immediate correction and results in an unacceptable rating.**

COMMMENTS: On the 5-11-89 inspection #31 was circled for accepting material other than insulation. I have spoke with Mike Heffernan about the dusts from Globe. The only material acceptable at this site are the insulation scrap. There are a couple of piles of what I think is "stack condenser dust" which needs to go to a full scale landfill.
#5 — The road is tracking mud on top of the fill. The waste needs to be worked so that water flows off of the fill.

No additional violations were noted, travel was visible.

COMMENTS: No violations were circled on the 3-31-89 inspection - #31 — The only material acceptable for this site is the scrap insulation from Globe. Today, there are a few loads of broken pallets or wood waste, empty barrels of Fulatex Polymer made by H.B. Fuller and a paper barrel with an unknown black material in it. The unknown barrel was set aside and not in the working face. I also spoke with Mike Heffernan of Globe about the "stock condenser dust" going to this site. I told him that the "stock condenser dust" needs to go to a full landfill, and that only insulation is acceptable at this site. There was dust on site today.

The waste is being spread, compacted, and covered in an acceptable fashion.

COMMENTS: No violation were circled on the 2-16-89 inspection. Our office received a complaint regarding the dumping of Globe's baghouse dust and demolition waste at the site. The dumping of demolition waste was being done on Saturday according to the complaint. I spoke with Michael Hoffman of Globe about the complaint. Globe has two types of baghouse dust. One dust is made of the short fibers and dirt generated from the handling of the raw material. This material does go to the Feddeler site. The second dust is also the dust

Received by: Robert Feddeler
Responsible Party

Operator

SBH64-029 Rev State Form 34505

fibers and dirt, however the phenolic resins are mixed in. This material is a special waste and is currently being ~~disposed of at~~ taken to Wheeler Landfill. Because of the potential dust problems our office may wish to consider both dusts special wastes. There are five rolloff boxes stored on site. One out of the five contains construction-demolition wastes. I have no problem with empty rolloffs being stored on boxes which contain Globe scrap, but boxes which contain waste other than Globe waste must be stored elsewhere, not on site. I did not see any dust or demolition wastes in the working face.

Increase the height of the dike between the ditch and the waste before dumping any closer to the ditch. There is some water trapped along the road. The surface should graded so that water flows
