1998 303(d) List of Impaired Waterbodies

WHAT IS AN IMPAIRED WATERBODY?

An Impaired Waterbody is a river, stream, lake or reservoir that does not meet Indiana's Water Quality Standards. These waters will be evaluated for their Total Maximum Daily Load (TMDL) - the amount of pollutant(s) that can be assimilated by a waterbody. The goal is to reduce or eliminate the source of the pollutant or pollutants that violate the Water Quality Standards.

[1]FCA - Fish Consumption Advisory
[2]PCB - Polychlorinated Biphenyls
[3]Hg - Mercury
[4]D.O. - Dissolved Oxygen

***Only waters for which fish tissue data support issuance of fish consumption advisories are individually cited above. The Indiana Department of Health has issued a general fish consumption advisory for all other waters of the state. This advisory was based on extrapolation of the fish tissue data that were available and generally recommends that if no site-specific advisory is in place for a waterbody, the public should eat no more than one meal (8 oz.) per week of fish caught in these waters. Women of child bearing age, women who are breast feeding, and children up to 15 years of age should eat no more than one meal per month. The basis for this general advisory is widespread occurrence of mercury or PCBs (or both) in most fish sampled throughout the state. Please refer to the most recent Fish Consumption Advisory booklet available through the Indiana Department of Health (317/233-7808). Sources of the mercury and PCBs are unknown for the most part, but it is suspected that they result from air deposition in many cases. This could mean that the sources are located outside state and national boundaries. Assessment and control of these pollutants may therefore require interstate and international measures which are beyond the scope of state environmental agencies. The 15 year schedule for TMDL development is subject to change.
