

Officer Involved Shootings:

Physiology, Experience and Emotions; More than just a shooting.

The class will center on officer reaction to Police involved shootings and how proper officer preparation before and proper care after an Officer Involved Shooting (OIS) can not only reduce stress, but provide a better environment for both public perception and officer health. A discussion of best practices for investigation of these events will also be included.

Information used has been gathered from many years of study of local OIS and a survey involving the responses from over 100 officers who have been involved in OIS events over the last 20 years.
