## WRITTEN HISTORICAL AND DESCRIPTIVE DATA PHOTOGRAPHS

REDUCED COPIES OF HISTORIC CONSTRUCTION DRAWINGS

**Location:** SR 257 over Veale Creek, 1.03 miles south of US 50, Washington Township,

Daviess County, Indiana

**Present Owner**: Indiana Department of Transportation

Date of

**Construction:** 1938-1939

**<u>Designer</u>**: Indiana State Highway Commission

Fabricator: Bergen and Bergen (Franklin, Indiana) with approach work completed by Works

Progress Administration (WPA) forces<sup>1</sup>

**Significance**: Bridge No. 257-14-03017A is a good example of a second-generation Indiana State

Highway Commission steel pony truss structure on the Indiana state highway system. The bridge is one of only a handful of pony trusses remaining on the state highway

system and it retains material integrity.

**Project** 

<u>Information</u>: The recordation of Bridge No. 257-14-03017A was prepared by the Indiana

Department of Transportation's (INDOT) Cultural Resources Office (CRO) staff. Written historical documentation was completed by Mary Kennedy and Susan Branigin and photographic documentation was completed by Patrick Carpenter.

Branigin and photographic documentation was completed by Patrick Carpenter.

**Description**: SR 257 over Veale Creek is located in a mostly rural area in southwestern Daviess

County, Indiana. Surrounding land use includes a dense floodplain forest with wetland areas on the east side of the road and prime farmland on the west. No residential properties are located within 1,000 feet of the bridge. The confluence of Hurricane Branch, a large tributary of Veale Creek is located approximately 75' east of the bridge. The closest intersections to the project location are CR 150 S located approximately 0.3 miles north of the bridge and CR 200 S located approximately 0.4

miles south of the bridge.

SR 257 over Veale Creek is a single span, riveted steel Warren Pony Truss with flat top chords. It has an 84' span that carries a reinforced concrete deck. Metal brackets, in line with the vertical members of the truss, extend perpendicularly to the outside of the truss. The trusses have six panels 14' in width for a total span of 84'. The bridge has a roadway width of 24' and has a total width of 26'-6.5" from center-to-center of the trusses. The distance from the bridge seat to the top chord is 10'. The bridge rests

on concrete abutments with concrete wing walls.

Since its construction in 1938, no significant alterations have occurred to the bridge, with its original design and original materials remaining largely intact. Repair work was undertaken in 1977 and 2009. In 1977, repairs to the bridge included replacement of the floor slab, cleaning and painting of the steel beams, and installation of guardrails and riprap. In 2009, INDOT posted a load limit of 12 tons on the bridge for safety reasons. The repairs in 2009 were to retrofit the bridge to remove the load restriction, and included bolting steel plates to the bottom cords.

This bridge is being inspected annually due to its deteriorating condition. It has a deficient clear roadway width and deficient load rating. The steel substructure is heavily rusted, and the lower cord/floor beam gussets have section loss and packed rust.

#### <u>Historical</u> <u>Narrative:</u>

#### Early Local Settlement and Development

Daviess County is located in the southwestern part of Indiana. It is bounded on the west by Knox County, on the south by Pike and Dubois counties, on the east by Martin County and on the north by Greene County. Daviess County was officially organized on February 2, 1817. The county had originally been part of Knox County, which was established in 1800 as the seat of Indiana's territorial government by the terms of the Northwest Ordinance of 1787. Knox County also included Posey, Vanderburgh, Warrick and Pike counties. Daviess County was named in honor of Captain Joseph H. Daviess, who was killed at the Battle of Tippecanoe on November 11, 1811.<sup>2</sup>

The topography of Daviess County ranges from hilly in the northeastern corner to more gently rolling and level land in the center and on its western border near the White River. Hilly terrain dominates the county's southern region. The county is drained by numerous creeks that are part of the White River watershed. The soils are both alluvial and sandy, making them conducive to the cultivation of diverse agricultural products, such as corn, grain, cantaloupes and watermelons.<sup>3</sup>

As elsewhere in southern Indiana, most of the early settlers in Daviess County came from the "Upland South," which consisted of the states of Virginia, West Virginia, Tennessee and the Carolinas. As the population grew, out of necessity, so did the transportation infrastructure on the local and state levels. Much of this growth was resultant of Indiana's Internal Improvements Act of 1836. By that year, the Vincennes and New Albany Turnpike was routed through the town of Washington in Daviess County.<sup>4</sup> In 1845, the Wabash and Erie Canal advanced into Daviess County.<sup>5</sup>

As was the case elsewhere in the state, the Wabash and Erie Canal's construction represented an economic boost to the local economy; a canal-associated land office was opened in Washington in 1845. A 23-mile section of the canal, from Newberry to Maysville, was let for contract on June 27, 1849 and cost \$160,000.<sup>6</sup> During its heyday the Wabash and Erie Canal system helped in the movement of people and goods across the state--as well as in Daviess County—but by 1860, "navigation had ceased south of Terre Haute."

#### Late Nineteenth and Early Twentieth Century Development

Like many other Indiana counties, from the mid 19<sup>th</sup> to the early 20<sup>th</sup> century, railroad development made a major impact on transportation in Daviess County. The advent of the railroad brought with it the improved statewide (and eventually, national) transportation of people and goods (particularly agricultural products) into and out of Daviess County.

By 1870 in Daviess County, the Wabash and Erie Canal had "sold out completely its right-of-way to the railroad." The Evansville and Indianapolis Railroad was constructed along the old canal route, and in 1883, it was completed from Petersburg to Newberry. This railroad track, for the most part, was built along the tow path of the former canal. The Evansville and Indianapolis Railroad line, which ran through Daviess County and Washington, eventually became part of the Big Four/Cleveland, Cincinnati, Chicago & St. Louis (CCC & St. L) railroad, which in turn was absorbed by the New York Central line.

The railroads enabled access to distant markets, and the railroad boom lasted through the early 20<sup>th</sup> century. The Baltimore and Ohio Railroad was a major line that ran the entire length of southern Indiana and connected the region to the state of Ohio. Additionally, repair shops for this railroad were located in Washington. They were the largest ones in the state at the time of their construction in 1889.<sup>10</sup>

During the Depression era, railroads continued to be the primary means of transportation of goods and people, and the advent of World War II increased rail traffic. However, the increasing popularity of the gasoline-powered automobile around the early 20<sup>th</sup> century completely changed the local road network. The automobile forced improvements to the entire road system. Roads transformed from narrow dirt paths to gravel and then concrete and asphalt. In Daviess County, 325 miles of county roads were gravel or macadam by 1914. <sup>11</sup>

The Federal-Aid Road Act of 1916 changed the face of road construction across the country, as for the first time, a regular appropriation of federal funding was made to states for road-building activities. This act required each state to, among other things, establish and maintain a state highway department to administer the new funds. Indiana became the last state to establish such a department with the creation of the Indiana State Highway Commission (ISHC) in June 1917. 12

In September 1917, the ISHC delineated and designated five main market highways. Road No. 5 was a 72.5 mile route that went from Vincennes through Washington and on to Mitchell. Later, Road No. 5 combined with parts of Road No. 4 (from Evansville through Seymour to Lawrenceburg) and became U.S. 50, which is a major roadway through Daviess County. <sup>13</sup>

Historic mapping shows that the stretch of SR 257 on which Bridge No. 257-14-03017A is located has been a transportation route in southwestern Indiana since at least 1876.<sup>14</sup> This section of roadway was taken over by the ISHC on October 16, 1934. It consisted of 15 miles from near the Pike-Dubois County line to the city of Washington.<sup>15</sup>

During the Depression, the Roosevelt Administration created New Deal programs to provide jobs for the numerous unemployed people across the country. These programs led to road construction and road improvements across the state of Indiana. Many took the form of Works Progress Administration (WPA; later named Works Projects Administration) projects. In Daviess County, for example, SR 57 was paved in 1936 as a WPA project. The plan sheets for Bridge No. 257-14-03017A indicate that the approach work was completed by WPA forces. 17

#### Mid-Late Twentieth Century and Early Twenty-first Development

Even before the onset of World War II made construction materials scarce, road building across the country began to decline significantly. In 1941, when the war in Europe started and before the United States had entered the conflict, President Roosevelt had supported reductions in highway funding that was not determined to be essential. The U.S. Bureau of Public Roads, under the direction of the War Department, designated a "strategic network" of 1,143 miles of state highways across the country, and the Defense Highway Act of 1941 provided funding for this network. With its central location, Indiana had several defense plants, military bases, and military-related industries, which meant that a substantial amount of mileage throughout the state was part of the strategic highway network.<sup>18</sup>

During World War II, the ISHC's focus was the preservation and upkeep of existing infrastructure, especially that which supported the movement of war materials and supplies. Very little new construction was undertaken, especially by the ISHC's Bridge Department which "stressed preservation of structures by repair work, new bridge floors, clearing channels, etc." ISHC Chairman Samuel C. Hadden also served as the president of the American Association of State Highway Officials (AASHO), and he advocated ramping up highway construction efforts as soon as the war ended. <sup>20</sup>

After World War II, the ISHC conducted a large-scale study from 1947-1948 of the condition of Indiana's roads and continued to advocate for massive increases in funding in order to implement the many needed improvements. <sup>21</sup> In the 1950s and 1960s, the state began planning and construction on the Interstate Road System, but much of southwestern Indiana, including Daviess County was not initially, and still is not, traversed by an interstate. Plans are currently underway for an extension of Interstate 69 from Indianapolis to Evansville, traveling through Daviess County, just east of Washington. Construction has been completed on some sections and is currently on-going for other sections.

Since its formation, Daviess County has primarily been rural and agricultural, and this holds true into the 21<sup>st</sup> century. Just over 70% of the total acreage of Daviess County is in agricultural use, and the county ranks 25<sup>th</sup> in land area in agricultural use among Indiana's 92 counties. Daviess County ranks in the top ten in Indiana in two agricultural production areas: 2<sup>nd</sup> in turkeys and 9<sup>th</sup> in wheat.<sup>22</sup> Two of Daviess County's top employers are also agricultural in nature: Perdue Foods, Inc. (turkey processing) and the Grain Processing Corporation (corn-based production).<sup>23</sup>

In the 21<sup>st</sup> century, tourism is also playing a role in the economy of Daviess County, especially as related to the Old Order Amish community. The first Old Order Amish families began settling in Daviess County in the late 1860s. As their population has grown over the decades, many have shifted or supplemented their livelihood from agricultural pursuits to manufacturing and cottage industries, including cabinet-making, quilting, and candy-making.<sup>24</sup> Even if not owned by the Amish themselves, several "Amish-related" tourist attractions exist in Daviess County, such as restaurants, furniture stores, candy stores, and quilt stores.<sup>25</sup>

#### Steel Pony Trusses in Indiana

The rise and proliferation of metal bridges in Indiana, according to one authority on the subject, was tied to that of the national railroad companies. Innovations brought about by the large railroad companies were not confined to improvements in the number of available rail routes, decreased travel times or to construction innovations like railroad depots, roundhouses, and repair shops. Changes also came in the conveyances that carried the trains themselves.<sup>26</sup>

Timber truss bridges could not withstand the increasing weight of the train cars, and they were also vulnerable to fires started by the errant sparks that flew from steam engines. These factors necessitated new, stronger construction in the bridges that would carry the rail lines, which in turn led to the proliferation of metal bridge construction in the state. Around the end of the 1880s, iron became the standard construction material for bridges in Indiana.<sup>27</sup>

Some railroad companies, such as the Baltimore and Pennsylvania, designed their own patented bridge types that were implemented on their lines, while other patented truss designs carried the names of their engineer-inventors. Examples of these truss types are Pratt, Warren, Parker, and Whipple. Engineering science became the rule in bridge design. Trusses were first connected by metal pins and later by rivets.<sup>28</sup>

The American industrial age coincided and had a symbiotic relationship with the growth of the railroad systems across the nation. Increased need for the production of iron and steel and the introduction of standardized bridge designs and parts gave rise to the production of bridge members at foundries and roller mills. They could be shipped to the construction site and assembled. Additionally, the widespread production and use of metals such as iron and steel decreased their price and made metal bridges more affordable for the local communities that had them constructed.<sup>29</sup>

The Warren truss, of which Bridge No. 257-14-03017A is an example, is a triangular truss type that was patented by James Warren and Willoughby Monzani in England in 1848. American Squire Whipple was unaware of the Englishmen's patented design when he created his own Warren truss in 1849. The first pinned Warren through truss in Indiana is believed to have been Hendricks County Bridge No. 216, constructed in 1886. Even though it was efficient at carrying loads, the Warren truss was not used heavily in the United States in the nineteenth century because of the "extensive wear experienced around the piers at center span. Without counters and often without verticals, the diagonals of the Warren through truss suffered around mid-span from the full impact of stress reversal."

After rivets replaced pins at panel points, Warren trusses gained some popularity, although more so by the railroads than road builders. Additionally, the pony truss form was used more frequently on roads than the through truss form. Through the 1930s and beyond, railroad companies often built all-riveted Warren through trusses, even after the Parker through truss had become the most popular design for highway bridges. The Warren pony truss, however, was a popular choice for roads with moderate traffic where mid-range crossings had to be made.<sup>32</sup>

Over the years, metal trusses have been disappearing from the Indiana landscape as deterioration and highway improvements that require roadway widening have resulted in their replacement. The Indiana Historic Bridge Inventory shows that a total of 124 metal pony trusses existed across the state on Indiana's publically-owned roadways in 2010.<sup>33</sup> Of that number, 68 were specifically Warren pony trusses. Of those Warren pony trusses, two were bedsteads, nine had polygonal top chords, and 57 had flat top chords like Bridge No. 257-14-03017A. Of those bridges, only six were located on state highways: three of the polygonal top chord type and three of the flat top chord type. No other examples of Warren pony trusses exist in Daviess County.<sup>34</sup>

#### Bridge No. 257-14-03017A

Bridge No. 257-14-03017A, carrying the north and south bound lanes of SR 257 over Veale Creek was built under ISHC Contract No. 1711, which was let on August 31, 1938. The contract included the construction of this bridge and another "twin" bridge on SR 257, Bridge No. 257-14-03016. Bridge No. 257-14-03016 was a similar steel pony truss that carried SR 257 over Aikman Creek, 5.63 miles south of US 50 (it was replaced with a pre-stressed concrete I-beam bridge in 2003). The cost to construct Bridge No. 257-14-03017A was \$19,849.70.<sup>35</sup>

One bridge historian notes that Bridge No. 257-14-03017A represents a period of transition in which the ISHC made modifications to standard designs from the 1920s:

[The ISHC] first widened the deck and made some of the diagonal and lower-chord members from heavier stock and added battens to the verticals and sway braces. Here the state's design engineers have further stiffened the verticals by lacing together their pairs of angles and also lightened the sway braces by reducing the number and size of their supporting plates. . . The revised standard plan shifted from the traditional latticed guardrails to a heavier post and channel arrangement. <sup>36</sup>

The members of Bridge No. 257-14-03017A were fabricated as such:

. . .members were shop-riveted into three sections per truss and then "spliced" together with field riveting at erection. The external sway braces share battens with the all-interior verticals--each of two pairs of angles (3.5"x3" Ls) riveted together with lacing bars. Pairs of different sizes of angles--heavier towards the ends (6"x4"Ls) than toward midspan (3.5"x3" Ls)--riveted together with battens supply the diagonals. Both the top and the lower chord members also become increasingly heavy toward midspan. The 10" channels of the top chord grow in weight from 15.3 lbs to 30 lbs. The 10" channels of the lower chord also start at 15.3 lbs and increase to 25 lbs. and in all but the outermost panel have a 7/16" to 3/8" plate riveted to each's [sic] side. The ISHC specified heavy floor beams (33"x132 lb Is) riveted to the verticals above the lower chord. Nine rows of rolled 12"x28 lb Is were attached to the sides of the floor beams as stringers. The floor beams and the stringers together carry the concrete deck. Angles supply the lower sway bracing.<sup>37</sup>

Bridge No. 257-14-03017A was designed and built in the midst of the Great Depression. It was a time when, despite many people experiencing great hardships and poverty across the nation, road building continued. Sustained work on America's highways was due, in part, to a growing obsession with the automobile. One historian notes that in the decade leading up to the Great Depression, one car existed in Indiana for every four residents.<sup>38</sup> During the Depression, Hoosier automobile registrations did not decline very much, and automobile fuel consumption stayed at pre-Depression levels with a rapid increase in the late 1930s. This fervor for motorized transportation, coupled with New Deal programs to put people back to work, resulted in improvements to roadways during the Depression era.<sup>39</sup> Across the country, from 1930 to 1940, the amount of surfaced roadways nearly doubled from 694,000 miles to 1,367,000 miles.<sup>40</sup>

The ISHC utilized federal money from a variety of programs to continue road building during the Depression. In 1932, it created a three-part approach for managing federal relief programs:

- (1) adding local miles to the state system—almost 1,500 miles were added
- (2) doing more contract construction, and
- (3) creating day-labor projects.<sup>41</sup>

Many roads in Indiana, such as SR 257 in this location, were improved because of their upgrade from local roads to state highways. As the ISHC obtained new jurisdiction and responsibility for more local roadways each year, the need for maintenance and new construction projects continued to grow. As mentioned earlier in this document, the stretch of SR 257 on which Bridge No. 257-14-03017A is located was taken over by the ISHC in 1934. ISHC survey crews visited the project site in August 1936 with the ultimate purpose being the "relocation and improvement of SR 257." Its designation from a local road to a state highway necessitated a physical and material upgrade.

The existing bridge at the site was a Pratt pony truss that only possessed a roadway width of 13'-8". It was described by the surveyors as being in "poor" condition overall.<sup>44</sup> The survey crew recommended a new "steel beam" bridge with 24' of roadway width because traffic volumes warranted the width increase.<sup>45</sup> Two long-time local residents reported to the surveyors that the existing bridge was "not adequate."<sup>46</sup>

In the ISHC report included in the annual yearbook for the State of Indiana for 1939, the presence of many inadequate bridges on the state road network was discussed. A survey of all bridges over 10' had just been updated, and it revealed "over 1,900 such bridges below the present standards of width, strength, and alignment, several hundred of them being in urgent need of replacement." <sup>47</sup>

The poor condition of so many of Indiana's bridges was even news that was covered by local media in Daviess County. An article from during the time of construction of Bridge No. 257-14-03017A reported the following:

A majority of these obsolete bridges were constructed by counties and townships prior to the establishment of the state highway system, at a time when there were comparatively few automobiles and fewer trucks. These bridges were not designed to carry either the volume or the type of traffic which moves over the state highway system today.<sup>48</sup>

The WPA is probably the most well-known of the New Deal agencies, and it is often identified with roadway projects, in part, because many bridge projects of the era carry a plaque commemorating the WPA involvement. Across the country, the WPA constructed 639,000 miles of roads and streets and 78,000 bridges. Almost half (49.3%) of Indiana's WPA funds were used for roadway and bridge construction. This funding totaled \$182,104,483 from 1935 to 1943. 49

The work by WPA crews on the part of SR 257 in which Bridge No. 257-14-03017A is located was completed ahead of the new bridge construction. Notations on the bridge plan sheets from June 1938 state that the roadway had already been "graded & surfaced by WPA forces." In that fiscal year (July 1, 1937 to June 30, 1938), roadway "maintenance and betterment costs" on nearly 71 miles of state highways in Daviess County totaled over \$50,000, with almost \$7,500 coming from WPA funds.<sup>51</sup>

One mention of the construction activities for Bridge No. 257-14-03017A was found in available local print media of the time. On January 28, 1939, the *Washington Democrat* reported that the SR 257 Bridge over Aikman Creek was open and that the "new bridge over Veale's [sic] creek on the same highway will be in service within a week." The new bridge over Aikman Creek apparently made quite an impression as it was described as a "splendid" structure. Both bridges were described as "substantial" and as "monuments to the good administrative work of the State Highway Commission." <sup>53</sup>

Further improvements to SR 257 were expected to continue through the rest of the year.<sup>54</sup> In May 1939, mention was found of an "oil treatment" along this stretch of SR 257. The work was to take place from south of Washington through Pikeville in Pike County.<sup>55</sup> No subsequent mention of the actual completion of Bridge No. 257-14-03017A was found, indicating the bridge was likely opened to traffic with little fanfare.<sup>56</sup> The ISHC report included in the state's yearbook for 1939 indicates that the contract for the construction of Bridge No. 257-14-03017A was closed out on June 16, 1939.<sup>57</sup>

Little is known about the contractor who constructed Bridge No. 257-14-03017A other than it was Bergen and Bergen of Franklin, Indiana. As part of the studies for the I-69 Indianapolis to Evansville project (Bridge No. 257-14-03017A is located within the Area of Potential Effect [APE] for Section 3), investigations were carried out at the Indiana State Library to find information about this firm. City directories and city and county histories were searched and no reference to this firm was found.<sup>58</sup> Bergen and Bergen did construct other bridges, including steel through trusses, for the ISHC.<sup>59</sup> For example, as part of the SR 44 road relocation project in 1940 through Shelby and Johnson counties, Bergen and Bergen was awarded a

contract to construct three bridges, including Bridge No. 044-73-03332A, a Parker through truss carrying SR 44 over Sugar Creek (this bridge is no longer extant).<sup>60</sup> Summary

Today, the SR 257 Bridge over Veale Creek is a significant example of a second-generation Indiana State Highway Commission-designed steel pony truss. The bridge retains material integrity and is a testament to the bridge design philosophy of this era, but also to the growing network of roads and highway improvements in Indiana's transportation history.

Bridge No. 257-14-03017A is deteriorated, including section loss and packed rust throughout the steel substructure. It has a deficient clear roadway width and deficient load rating for current standards of a roadway of its classification. The bridge is scheduled for replacement with construction beginning in 2012. The purpose of the replacement project is to maintain a safe river crossing and address the geometric and structural deficiencies with the current bridge. The new structure will be an approximately 122' long three-span bridge built on approximately the same alignment as the existing bridge.

Bridge No. 257-14-03017A will be dismantled and stored by INDOT. The bridge will be stored for a period of ten (10) years or until the bridge is removed and reused by a suitable applicant, whichever occurs first.

The perpose of this distinct is to above a method for locating the proper elevation for the top of slob while pointing to estimate surface of the sub to the grade shown on the plans when all concrete has blon pointed.

The method suggested a as follows:

The PLAN subcales a screen at the contentine of each floorboot. Each point where a screen consect a stringer line is summeried. The point's warre the screens; if extended, must cross the back of carries one also numbered. The Table of Electrons shows as about an far and your These about any one by if this for points on all limits except it and it is how to play the action of courses are play of cart in good of these about any in the far points on the two play and any of cart and the far points of the cart and the far points of cart and the far points of the far points of cart and the far points of the far points of the far points of cart and the far points of the far points o

### FABRICATION & ERECTION NOTES

All Structural Steel shall conform to ASIM 36 unless otherwise rioled.

If the abricator uses these drawings for shap plans, he shall check the same and assume tall responsibility for the occuracy of the details.

The neight of high strength bolts is not included in the estimated weight of Structural Steel. The cost of these bolts shall be included in the cost of Structural Steel.

All point shall be in accordance with Pointing Structural Steel Special Provisions.

Shap Point line Cilicate Paint, Field Paint Vinyl Finish Cool

Meteria's as listed on the shap drawings which do not require mill lest reports may be changed from that shown on the contract plans subject to approval. The material specification shall be given on the shap drawings if ifferent than that an contract plans. See Art 711.07 at Specifications.

shop drawings if ifferent than that an contract plans. See Art 711.07

It specifications

Rivets shell not be used in the assembly of structural steel.

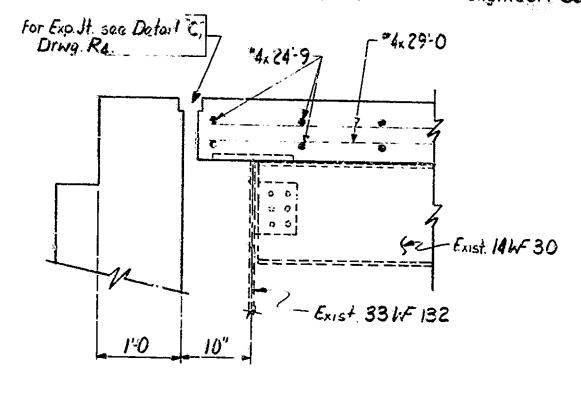

This soon as the engineer has approved the field walds, all welds on any surface from which the stop coat has been omitted or becomes worn siff or has otherwise become defective shall be thoroughly cleaned of all charged paint or any foreign matter and completely covered with one coat of shop point.

The Charpy V Notch toughness requirements, specified in Art. 909.02 of the supplemental Specifications, will not be required for steel used in this project.

Estimated weight of structural steel: 6040 lbs.\*

The weight includes 1040 lbs of structural steel shown in detail plans plus an additional 5000 ins. to be used for stringer and connection replacement as determined by the Engineer.

The contractor shall prepare detailed working or shop drawings to enable him to tabricate erect, and construct all parts of the work in conformity with the engineers drawings and specifications and submit four (4) copies to the engineer. See Art. 711.04 of the Specifications.

## BRIDGE SUMMARY INDIANA STATE HIGHWAY COMMISSION

DATE January 18, 1977

SHEET 6 OF 18

PROJECT: ST-4114 A
CONTRACT NO: B-10992
BRIDGE FILE: 257-14-3017 A

STARTED DEM

WOTES:
Weight of Spirels includes weight of 1/2 extra turns top and knotions.
Spacers and 1/2 turns at laps included in cost of Spirel.

\*\*\* The weight of structural steal is apprendicate only, and it should be the Contractor's responsibility to determine the energht on which he bases his bid.

For Test Boy Samples See Bridge Standard C1.
