Information Bulletin #2 (Fourth Amendment)

SUBJECT: Roster of Indiana Animals, Insects, and Plants that are Extirpated, Endangered, Threatened, or Rare (also described as Special Concern)

I. HISTORY:

The initial roster was published February 1, 1992 (15 IR 848), republished April 1, 1991 (15 IR 1312), and subsequently amended to include additional species and published on February 1, 2005 (28 IR 1581).

Since 2005, revisions have been made to several of the endangered species lists in this document. The term "special concern" replaces the references to "rare" as it relates to wild animals and is expanded to include species in a legal status transition. Federal funding is available for species that are endangered or of special concern, which also supports the modification of the definition of species of "special concern". The classification of a wild animal as "extirpated" is problematic, and the list of "extirpated" mammals, birds, reptiles, amphibians, crustaceans, mollusks, and fish is removed. The classification "extirpated" implies that a species has no legal status in Indiana, just because it is no longer found in Indiana. Determining that a species is actually extirpated can be extremely difficult for cryptic species, such as mussels, some turtles, some birds, and others. Additionally, animals are mobile and may attempt to recolonize Indiana, making an accurate list very difficult to maintain.

In this document, "rare", "threatened", and "extirpated" classifications for insect species are retained. Classification definitions have been added for vascular plant species.

II. INTRODUCTION

Following is a roster of animals, insects, and plants considered in Indiana by the Department of Natural Resources to be extirpated, endangered, threatened, or rare (also described as special concern). The roster is intended to help identify these animals and plants, and the hope is that a better understanding of the fragility of these species will promote intelligent land use decisions. This roster may also be cross-referenced in rules and other documents directed to land use management.

Inclusion of an animal or plant on the roster is determined based on the best current information available. Adjustments to the listing will be required as additional data becomes available to the department and as the conditions of species change. For this reason, adjustments will be needed periodically to this roster, and those adjustments will be set forth in later editions of the roster.

Additional information concerning particular species included on the roster may be obtained from the Department of Natural Resources, Division of Fish and Wildlife and Division of Nature Preserves. G. INSECTS

1. Extirpated: An insect is considered state extirpated if any of the following three conditions occur: (a) A species is declared extirpated by a specialist for the species, family, or order to which the insect belongs. (b) A species has not been located in Indiana as a naturally occurring breeding population for more than 15 years, but the species exists outside Indiana as a wild population. (c) A species appears on a federal list as being extirpated in Indiana. Applying this standard, the following species are believed extirpated in Indiana:

(b) A species is biologically dependent on a threatened or endangered plant species. (c) A species is known from fewer than five sites in Indiana.

An insect is also considered endangered if the insect is listed as extirpated but is later rediscovered in Indiana, whether the population is endemic or believed to be recently adventive. The discovery of any life stage of an extirpated or endangered species is fiduciary evidence that a population exists.

An endangered species of insect does not include any of the following: (a) A species that is not known as a population in Indiana but which ranges into the state from Michigan, Ohio, Illinois, or Kentucky. (b) A nonregulated adventive species. (c) A species regulated under [IC 14-24](#) and [312 IAC 18-3](#) (including a species used for biological control).
