Sec. 10. (a) Maximum crop and annual loading rates are determined for a biosolid or industrial waste products to be applied

on the basis of the following parameters:

(1) Crop application rates, based on plant available nitrogen (PAN) loadings using the appropriate formulas in subsection (b), shall not exceed either of the following:

(A) PAN loading rates for crop production in Table 5 as follows:

Table 5

Plant Available Nitrogen Loading for Crop Production

Crop	Pounds of PAN Per Acre ¹
Corn	200
Soybeans	100
Hay, pasture	100
Cereal grain	100
Set aside/idle	50

¹An equivalent method of meeting the nutrient management requirement may be submitted to the commissioner for approval for alternative nutrient loading rates that provide equivalent or greater protection to the environment and public health.

(B) The nitrogen removal rate for the proposed crop to be grown on the land application site adjusted to account for application of fertilizers, manure, and the presence of residual available nitrogen in the soil from previous applications of a biosolid, industrial waste product, or pollutant-bearing water.

(2) Annual loading rates of a biosolid or industrial waste product must not result in any of the annual pollutant loading rates in Table 4 in section 9(d) of this rule being exceeded. The following formula for annual loading rate calculation applies to this article and must be used to calculate the amount of biosolid or industrial waste product to be applied per acre per three hundred sixty-five (365) day period:

$$ALR = \frac{APLR}{C \times 0.002}$$

Where: ALR = Annual loading rate in dry tons per acre per three hundred sixty-five (365) day period (dry, short ton of biosolid or industrial waste product/acre/year).

APLR = Annual pollutant loading rate in pounds per acre per three hundred sixty-five (365) day period (pounds/acre/year).

C = Pollutant concentration in milligrams per kilogram of total solids (mg of pollutant/kg of biosolid or industrial waste product dry weight).

(3) Phosphorus loading requirements may be included as a permit condition if the commissioner determines it is necessary for protection of public health or the environment.

(b) The following formulas for PAN loading calculations apply to this article and must be used to calculate the amount of PAN in the biosolid or industrial waste product and the residual available nitrogen at the application site; all calculations are based on a percent dry weight basis:

(1) %Total N = %Total Kjeldahl N + %Nitrate N

(2) %Organic N = %Total N - (% Ammonia N + %Nitrate N)

(3) Pounds Organic N per dry ton of industrial waste product or biosolid, except anaerobically digested biosolid, available during year of application = %Organic N × 6

(4) Pounds Organic N per dry ton of anaerobically digested biosolid available during year of application = %Organic N × 4

(5) Pounds of Ammonia N per dry ton = % Ammonia N × 20

(6) Pounds of Nitrate N per dry ton = %Nitrate N × 20

(7) Pounds PAN per dry ton = Pounds of Organic N per dry ton + Pounds of Ammonia N per dry ton + Pounds of Nitrate N per dry ton

(8) Residual nitrogen from past biosolid or industrial waste product applications:

(A) Pounds of residual N from industrial waste product or biosolid, except anaerobically digested biosolid, available one (1) year after application = %Organic N × 3 × dry tons applied per acre

- (B) Pounds of residual N from anaerobically digested biosolid available one (1) year after application = %Organic N $\times 2 \times$ dry tons applied per acre
 (C) Pounds of residual N from industrial waste product or biosolid, except anaerobically digested biosolid, available two (2) years after application = %Organic N $\times 1.6 \times$ dry tons applied per acre
 (D) Pounds of residual N from anaerobically digested biosolid available two (2) years after application = %Organic N \times dry tons applied per acre
 (E) Pounds of residual N from industrial waste product or biosolid, except anaerobically digested biosolid, available three (3) years after application = %Organic N $\times 0.8 \times$ dry tons applied per acre
 (F) Pounds of residual N from anaerobically digested biosolid available three (3) years after application = %Organic N $\times 0.5 \times$ dry tons applied per acre

Where: N = Nitrogen.

Affected: IC 13-11-2-77; IC 13-30-2-1

Sec. 15. (a) One (1) of the vector attraction reduction requirements in subsection (b) or an equivalent vector attraction reduction method as approved by the commissioner on the recommendation of the U.S. EPA must be met when biosolid is applied to any land application site.

(b) The following is a list of alternative vector attraction reduction requirements for a biosolid applied to the land:

(1) The mass of volatile solids in the biosolid is reduced by a minimum of thirty-eight percent (38%) as determined using EPA-

625/R-92/013*.

(2) When the thirty-eight percent (38%) volatile solids reduction requirement in subdivision (1) cannot be met for an anaerobically digested biosolid, vector attraction reduction is demonstrated by digesting a portion of the previously digested biosolid anaerobically in the laboratory in a bench-scale unit for forty (40) additional days at a temperature between thirty degrees Celsius (30°C) and thirty-seven degrees Celsius (37°C). When, at the end of the forty (40) days, the volatile solids in the biosolid at the beginning of that period is reduced by less than seventeen percent (17%), vector attraction reduction is achieved.

(3) When the thirty-eight percent (38%) volatile solids reduction requirement in subdivision (1) cannot be met for an aerobically digested biosolid, vector attraction reduction is demonstrated by digesting a portion of the previously digested biosolid that has a percent total solids of two percent (2%) or less aerobically in the laboratory in a bench-scale unit for thirty (30) additional days at twenty degrees Celsius (20°C). When, at the end of the thirty (30) days, the volatile solids in the biosolid at the beginning of that period is reduced by less than fifteen percent (15%), vector attraction reduction is achieved.

(4) The specific oxygen uptake rate (SOUR) as determined using Part 2710 B* for a biosolid treated in an aerobic process is equal to or less than one and one-half (1.5) milligrams of oxygen per hour per gram of total solids at a temperature of twenty degrees Celsius (20°C).

(5) A biosolid is treated in an aerobic process for fourteen (14) days or longer. During that time, the temperature of the biosolid must be higher than forty degrees Celsius (40°C) and the average temperature of the biosolid must be higher than forty-five degrees Celsius (45°C).

(6) The pH of a biosolid is raised to 12 or higher by alkali addition and, without the addition of more alkali, must remain at 12 or higher for two (2) hours and then at 11.5 or higher at the time the biosolid is applied to the land or distributed in a marketing and distribution program under 327 IAC 6.1-5.

(7) The percent total solids of a biosolid that does not contain unstabilized solids generated in a primary wastewater treatment process is equal to or greater than seventy-five percent (75%) at the time the biosolid is applied to the land or distributed in a marketing and distribution program under 327 IAC 6.1-5.

(8) The percent total solids of a biosolid that contains unstabilized solids generated in a primary wastewater treatment process is equal to or greater than ninety percent (90%) at the time the biosolid is applied to the land or distributed in a marketing and distribution program under 327 IAC 6.1-5.

(9) A biosolid injected below the surface of the land must:

(A) have no significant amount of the biosolid present on the land surface within one (1) hour after the biosolid is injected; and

(B) when the biosolid is Class A under section 13(b) of this rule, with respect to pathogens, be injected below the land surface within eight (8) hours after being discharged from the pathogen treatment process.

(10) A biosolid applied to the land surface must:

(A) unless otherwise approved by the commissioner, be incorporated into the soil within six (6) hours after application to or placement on the land; and

(B) when a biosolid is Class A under section 13(b) of this rule, with respect to pathogens, must be applied to or placed on the land within eight (8) hours after being discharged from the pathogen treatment process.

(c) For purposes of subsection (b)(6), the pH of biosolid must be measured at twenty-five degrees Celsius (25°C) or measured at another temperature and then converted to an equivalent value at twenty-five degrees Celsius (25°C).
