Report Overview and Methodology

Myers and Stauffer has produced this tabular report identifying the estimated number of PACE eligible individuals in each Indiana zip code for the Indiana Family and Social Services Administration (FSSA). It is the first of a series of reports for the PACE Feasibility Study. Subsequent reports will include a PACE Profiles Report and a Proposed PACE Regions Report. The tables in this report show estimates of PACE eligible people in Indiana and include the data and methods that were used to calculate the estimates.

To estimate the number of people that would likely be eligible for the PACE program, Myers and Stauffer relied on three qualifying factors: individuals must be age 55 or over, they must meet a clinical eligibility threshold, and they must meet a financial eligibility threshold. This report used data from the American Community Survey (ACS) completed in 2013 to determine estimates for each of these factors.

Myers and Stauffer utilized several different tables from the ACS to perform this study. Population estimates were taken from Census Table S0101 (2013). Since additional data needed to estimate clinical and financial eligibility were only available for the age 65 and over population, the ACS estimates of the age 65 and over population only were used in this report. This resulted in a conservative estimate of PACE eligible people since the eligibility criteria also includes those individuals that are between age 55 and age 64. FSSA agreed that this conservative approach was appropriate.

Two ACS tables were used to estimate the number of people that would be clinically eligible for PACE. Census Table B18106 (2009-2013) was used to determine the number of people living in each zip code who were age 65 and over and who reported a self-care difficulty. According to the website socialexplorer.com, this table was derived from responses to question 18c of the ACS, which asked respondents if they had "difficulty dressing or bathing." Difficulty with these activities are two of six specific Activities of Daily Living (ADLs) often used by health care providers to assess patients' self-care needs¹. The data taken from Census Table B18106 was used to determine a low estimate of the number of people that would meet PACE clinical eligibility criteria.

The second table used to determine the number of people that would meet the clinical eligibility threshold was Census Table B18107 (2009-2013). It was used to identify the number of people living in each zip code who were age 65 and over and who reported an independent living difficulty. According to socialexplorer.com, this table was derived from responses to ACS question 19, which asked respondents if due to a physical, mental, or emotional condition,

¹ https://www.socialexplorer.com/data/ACS2012_5yr/metadata/?ds=ACS12_5yr&table=B18106

they had difficulty "doing errands alone such as visiting a doctor's office or shopping." Difficulty with this activity is one of several Instrumental Activities of Daily Living (IADL) used by health care providers in making care decisions². Data from Census Table B18107 was used to calculate a high estimate of individuals that would meet PACE eligibility criteria.

To estimate the number of people that would meet the PACE program financial eligibility threshold, Myers and Stauffer used data from Census Table B17001 (2009-2013). This table lists the number of people that lived at or below the poverty level in the last 12 months. The data for the age 65 and over population was used to estimate the percentage of people living in each zip code who were age 65 and over and living below the poverty level. Since the Indiana PACE eligibility criteria is actually much higher than the poverty level, the calculated rate of those living below the poverty level was multiplied by a factor of 2.2. FSSA agreed that this would provide a reasonable adjustment to account for the higher financial eligibility threshold allowed for the PACE program.

The individual measures of clinical and financial eligibility were then used together to determine an estimate of PACE eligible people living in each zip code. A low estimate of the number of eligible people was calculated by multiplying the adjusted poverty rate by the number of people who reported a self-care difficulty. A high estimate was calculated by multiplying the adjusted poverty rate by the number of people who reported an independent living difficulty. In zip codes where the adjusted poverty rate exceeded 100% the low estimate was held to the number of people that reported a self-care difficulty, and the high estimate was held to the number of people who reported an independent living difficulty. To finish, the high and low estimates were then averaged together to determine a mean estimate of the number of people that would be eligible for PACE in each zip code.

To evaluate the density of the PACE market in each zip we compared the estimated number of eligible residents to the land area of each zip code. We pulled the land area in square miles for each zip code from Census Table G001. We divided the estimated number of eligible people in each zip code by the area of the zip code to calculate an average number of eligible people per square mile. This provides a statistic for comparing the market density of different zip codes that is neutral with respect to the size of the zip code area. In other words, it makes the comparison of market potential between zip codes an "apples to apples" comparison. Without this adjustment, some zip codes might appear to provide a rich PACE market just because of the large land area covered by that market.

To illustrate the market density across Indiana, we created a map showing the number of estimate eligible residents per square mile in each zip code within the state. The greater the

² https://www.socialexplorer.com/data/ACS2013_5yr/metadata/?ds=ACS13_5yr&table=B18107

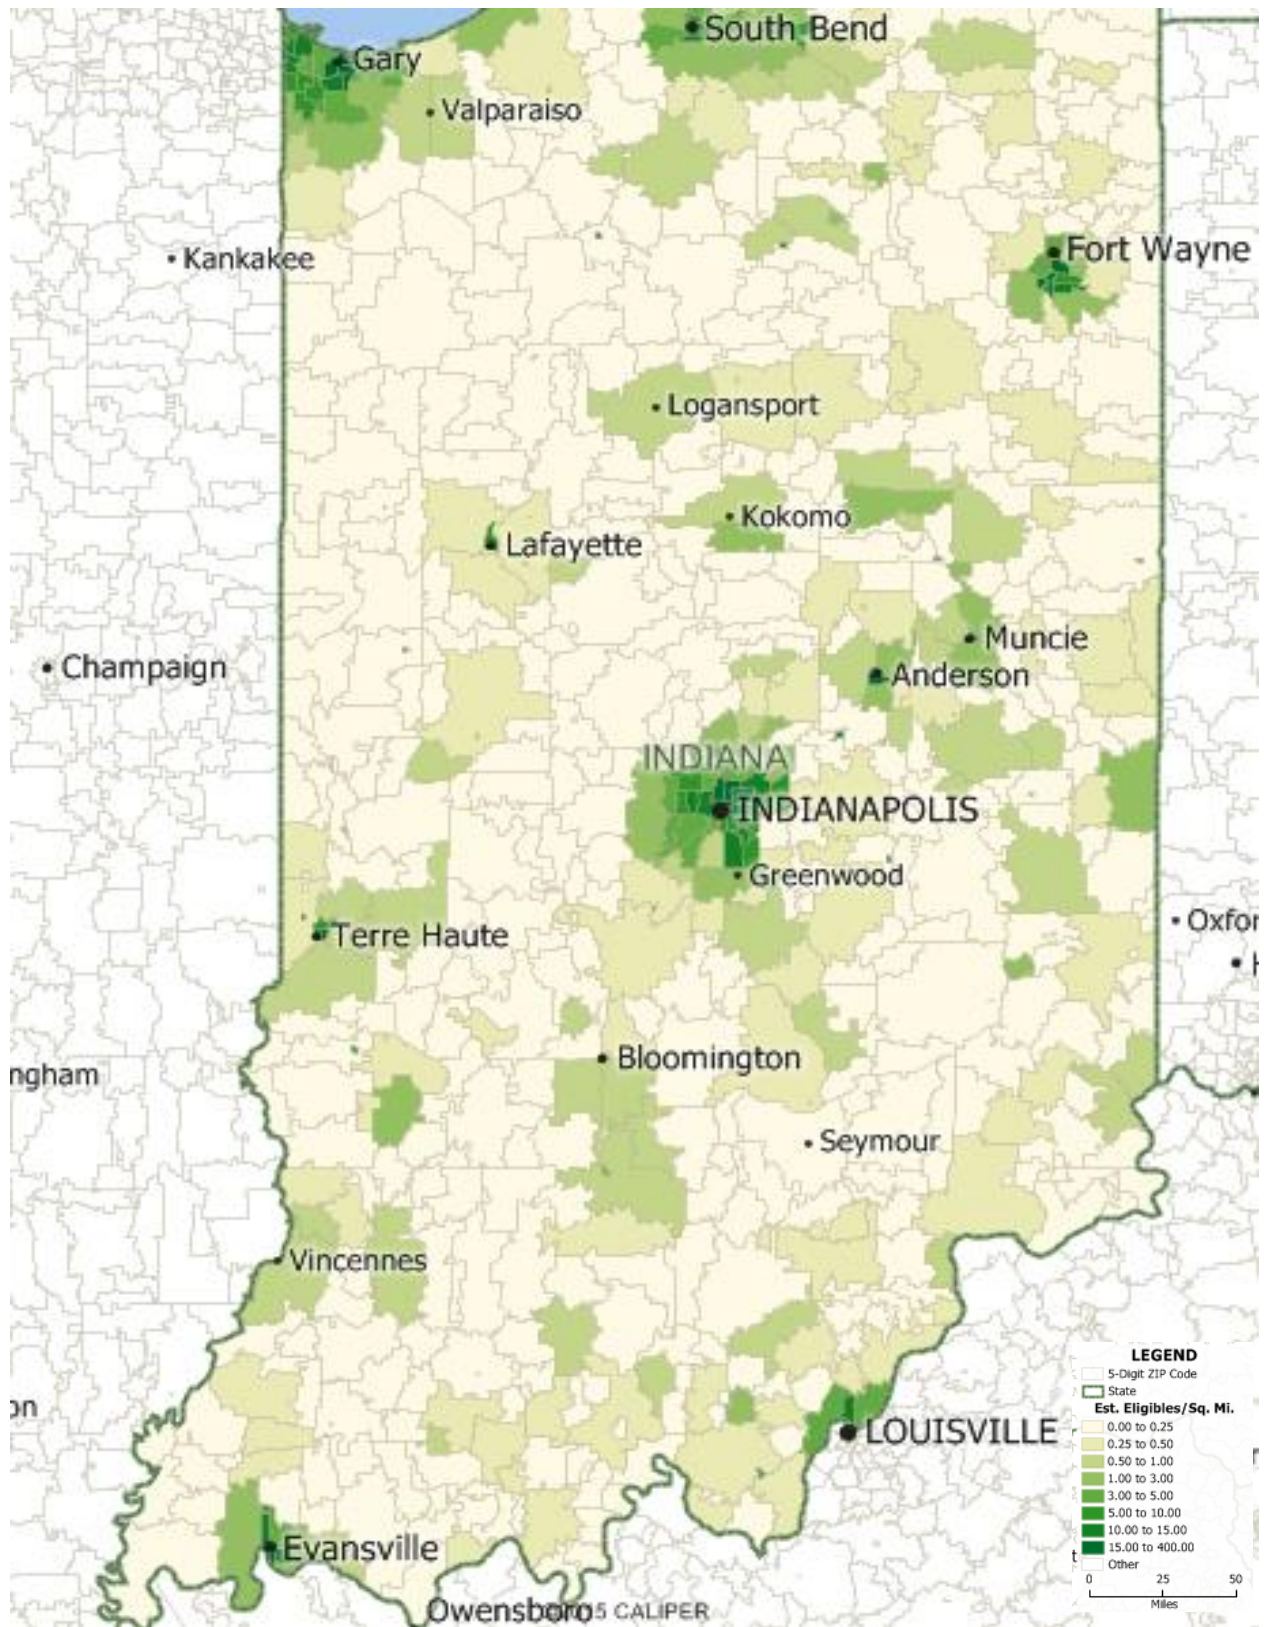

market density (higher the number of eligibles per square mile) the darker the shading for the zip code. This illustration appears on page 6.

The report also presents the eligibility estimates by location in two tables. The first sorts this information according to five-digit zip codes. The second presents the estimated number of eligible people according to three-digit zip codes, which may be helpful in evaluating larger geographic areas. It essentially summarizes the totals for the five-digit zip codes into 20 broader areas. The three-digit zip codes represent the first three digits of each five-digit zip code.

Three appendices are included to assist with the interpretation of this data. Appendix A includes seven maps to show the location of each zip code. The five-digit zip codes are located on six regional maps of the state: Northwest, Northeast, West Central, East Central, Southwest, and Southeast. The 20 three-digit zip codes are shown on one map for the entire state.

There are two appendices that list zip codes paired with counties. Appendix B lists the five digit zip codes sorted by counties. Appendix C lists the counties sorted by the five-digit zip codes. These resources are especially valuable since readers are not likely to be familiar with the locations of all the zip codes in Indiana.
