Revised Certification of Agricultural Land Base Rate Value for Assessment Year 2010

This memorandum hereby serves to notify assessing officials of the agricultural base rate to be used for the March 1, 2010 assessment date: **$1.290 per acre**. This replaces and supersedes the previous amount of $1,400 per acre certified December 31, 2009.

Land used for agricultural purposes shall be adjusted consistent with the guideline methodology developed for the 2002 general reassessment agricultural land value except, in determining the annual base rate, the Department of Local Government Finance ("Department") shall adjust the methodology to use a six (6) year rolling average instead of a four (4) year rolling average. **Senate Enrolled Act 396–2010, signed by Governor Mitch Daniels on March 25, 2010, requires the highest year of the six-year average to be excluded in the calculation** [IC 6-1.1-4.5(e)(2))]. The Department will issue annually, before January 1, the base rate to be applied for the following March 1 assessment date. 50 IAC 21-6-1(a).

Those portions of agricultural parcels that include land and buildings not used agriculturally, such as homes, homesites, and excess land and commercial or industrial land and buildings, shall be adjusted by the factor or factors developed for other similar property within the geographic stratification. The residence portion of agricultural properties will be adjusted by the factors applied to similar residential properties. 50 IAC 21-6-1(b).

The 2010 assessment year agricultural land value utilizes the land’s current market value in use, which is based on the productive capacity of the land, regardless of the land’s potential or highest and best use. The most frequently used valuation method for use-value assessment is the income capitalization approach. In this approach, use-value is based on the residual or net income that will accrue to the land from agricultural production.

As illustrated in the following equation, the market value in use of agricultural land is calculated by dividing the net income of each acre by the appropriate capitalization rate.

\[
\text{Market value in use} = \frac{\text{Net Income}}{\text{Capitalization Rate}}
\]

The net income of agricultural land can be based on either the net operating income or the net cash rent. Net operating income is the gross income received from the sale of crops less the variable costs (i.e., seed and fertilizer) and fixed costs (i.e., machinery, labor, property taxes) of producing crops. The net cash rent income is the gross cash rent of an acre of farmland less the property taxes on the acre. Both methods assume the net income will continue to be earned into perpetuity.

The capitalization rate converts the net income into an estimate of value. The capitalization rate reflects, in percentage terms, the annual income relative to the value of an asset; in this case agricultural land. Conceptually, this capitalization rate incorporates the required returns to various forms of capital, associated risks, and the anticipated changes over time. Since agricultural land in Indiana is nearly evenly divided
between cash rent and owner-occupied production, the Department utilized a six-year rolling average (2002 to 2007) of both methods in determining the market value in use of agricultural land. The capitalization rate applied to both types of net income was based on the annual average interest rate on agricultural real estate and operating loans in Indiana for this same period. The table below summarizes the data used in developing the average market value in use.

Note: Per SEA 396 – 2010, the highest year of the six (6) years is not included in the calculation. For the March 1, 2010 assessment, 2007 is not included in the calculation because it is the year out of the six with the highest average. The $1,290 reflects rounding.

The statewide agricultural land base rate value for the 2010 assessment year will be $1,290 per acre.

Dated this 26th day of March, 2010.

Brian E. Bailey, Interim Commissioner
Department of Local Government Finance

Cathy Wolter, Staff Counsel

\(^1\) The Operating Income for 2006 was changed slightly from last year’s calculation. This was the result of the Indiana Agricultural Statistics Service updating the published data. The change was made to the November 2006 price per bushel for both corn and soybeans. Corn was increased from $3.01 to $3.03 per bushel and soybeans were increased from $6.10 to $6.13. This slight change would have had no impact on the March 1, 2009 base rate of $1,250, which the Department certified in December 2008.
