1.0 PURPOSE AND NEED FOR ACTION

1.1 Proposed Action

The Indiana Department of Natural Resources (IDNR), Division of Entomology & Plant Pathology and Division of Forestry, proposes a cooperative project with the United States Department of Agriculture (USDA), Animal Plant Health Inspection Service (APHIS) to treat the gypsy moth populations at one site in Delaware county that covers an estimated 299 acres (Table 1 & see map in Appendix B). The preferred alternative for the cooperative project is Alternative 2: Btk.

Table 1. Treatment Site and Acres by County and Treatment Method for 2007 (also see Appendix B).

** Ground treatment is not part of the cooperative project.

1.2 Project Objective

The objective for this cooperative project is to eradicate gypsy moth by eliminating reproducing populations from the proposed treatment site.

1.3 Need for Action

Gypsy moth is not native to the United States, and it lacks effective natural controls. The caterpillars feed on the foliage of many host plants. Oaks are the preferred host species, but the caterpillars defoliate many species of trees and shrubs when oaks are not available. When high numbers of gypsy moth caterpillars are present, forests and trees suffer severe defoliation, which can result in reduced tree growth, branch dieback and even tree mortality. The high numbers of caterpillars also create a substantial public nuisance and can affect human health.

The State of Indiana, with the IDNR, Division of Entomology and Plant Pathology as the lead agency, is dedicated to preserving urban and rural forested habitats from damage by
gypsy moth and to enforcing interstate and intrastate quarantines to further protect areas not currently infested by this pest.

If no action is taken, gypsy moth will increase and spread and defoliation will occur sooner. Therefore, the "no action" alternative is not preferred due to state officials desire to eliminate the isolated infestations, prevent human discomfort associated with infestations, delay damage to local plant communities and reduce spread to adjacent uninfested areas. Local citizens agreed that the “no action” alternative is not preferred through the scoping process (Appendix A).

1.4 Decisions to be made and Responsible Officials

The preferred alternative in this document proposes cooperative participation of the IDNR and the APHIS in treating gypsy moth populations in Indiana. The decision to be made by the responsible APHIS official is to choose which of the alternatives presented in this document best fulfills the objectives of the proposed action, and thus the needs of the people of Indiana. In addition, the decision will have to be made as to whether or not any perceived significant environmental impacts could result from the implementation of this project. If there are none, this will be documented in a Decision Notice and FONSI (Finding of No Significant Impact). If significant environmental impacts are found and the project is to continue, an Environmental Impact Statement (EIS) would be prepared.

The alternatives analyzed for this environmental assessment are: 1) No cooperative project (No action), 2) Btk, 3) Mating disruption, 4) Mass trapping.

The responsible APHIS official who will make this decision is:

Gary Simon, State Plant Health Director, USDA, Animal and Plant Health Inspection Service, 120 Professional Court Suite D, Lafayette, IN 47905, (765) 446-0267.

The responsible officials for the implementation of the cooperative project in the Indiana IDNR are:

Robert D. Waltz, Ph. D., State Entomologist, Indiana Department of Natural Resources, Division of Entomology and Plant Pathology, 402 West Washington Street, IGC South, Room W290, Indianapolis, IN 46204, (317) 232-4120

John Seifert, State Forester, Indiana Department of Natural Resources, Division of Forestry, 402 West Washington Street, IGC South, Room W296, Indianapolis, IN 46204, (317) 232-4105.
1.5 Scope of the Analysis

A final environmental impact statement (FEIS), developed by the USDA, APHIS and Forest Service (USFS), entitled Gypsy Moth Management in the United States: a cooperative approach (USDA 1995) was made available in November 1995. The Record of Decision for the FEIS was signed in January of 1996 (USDA 1996), and Alternative 6 was selected, which includes all three management strategies analyzed – suppression, eradication, and slow-the-spread. These strategies depend upon the infestation status of the area: generally infested, uninfested, and transition. Implementation of the FEIS preferred alternative requires that a site-specific environmental analysis be conducted to address local issues before federal or cooperative projects are conducted. This site-specific analysis is tiered to the programmatic environmental impact statement (USDA 1995). As part of the analyses conducted for the FEIS, human health and ecological risk assessments were prepared (Human Health Risk Assessment, Appendix F to the FEIS and Ecological Risk Assessment, Appendix G to the FEIS). The purpose of tiering is to eliminate repetitive discussions of the issues addressed in the FEIS (40 CFR, 1502.20 and 1508.28 in Council on Environmental Quality, 1992).

1.6 Summary of Public Involvement and Notification

A public meeting was held during January 2007 (Appendix A). Notices were delivered to elected officials, interested groups, residents and local media. At the meeting, state officials presented alternatives for gypsy moth management. The discussion included identification and biology of gypsy moth, pest impacts, survey methods, and control tactics. The proposed actions and alternatives, including no action, were discussed. Local issues, questions and concerns raised at the public meetings are included in Appendix A.

Information gathered at the public meeting and from resource professionals was used to develop issues and concerns related to the project. They are grouped into two categories; 1) issues used to formulate alternatives, and 2) other issues and concerns.

1.7 Issues Used to Formulate the Alternatives

Each of the major issues is introduced in this section. Discussion pertaining directly to each issue as it relates to the alternatives can be found in Chapter 4.

Issue 1 - Human Health and Safety. Three types of risk are addressed under this issue: 1) an aircraft accident during applications, 2) treatment materials and potential effects on people, and 3) the future effects of gypsy moth infestations on people.

Issue 2 - Effects on Non target Organisms and Environmental Quality. The major concerns under this issue are: 1) the impact of treatment materials to non target organisms, including threatened and endangered species that may be in the treatment sites, and 2) the future impacts of gypsy moth defoliation on the forest resources, water quality, wildlife and other natural resources.
Issue 3 - Economic and Political Impacts of Treatment vs. Non-Treatment. Gypsy moth outbreaks can have significant economic impacts due to effects on the timber resource, nursery and Christmas tree producers, and recreational activities. An additional economic impact is a gypsy moth quarantine imposed to regulate movement of products from the forest, nursery and recreational industries to uninfested areas.

Issue 4 - Likelihood of Success of the Project. The objective of this project is reducing the spread rate of gypsy moth within Indiana. Alternatives vary in their likelihood of success for the current situation in Indiana. Measurement of project success is important for delaying gypsy moth impacts to Indiana and neighboring states.

1.8 Other Concerns and Questions

Concerns and questions were discussed during the public meetings (see Appendix A). Also, other agencies were consulted (see Appendix C). Information from these sources was used to develop mitigating measures, management requirements and constraints.

1.9 Summary of Authorizing Laws and Policies

State. The Division Director (State Entomologist) may cooperate with a person in Indiana to locate, check, or eradicate a pest or pathogen (Indiana Code 14-24-2-1). The Division Director may, on the behalf of the department, enter into a cooperative agreement with the United States government, the government of another state, or an agency of the United States or another state to carry out this article (Indiana Code 14-24-2-2). Aerial applicators must meet Indiana Pesticide Use and Application Law (Indiana Code 15-3-3.6) to provide safe, efficient and acceptable applications of pesticides. The Non-Game and Endangered Species Conservation law (Indiana Code 14-22-34) applies to this project.

Federal. Authorization to conduct treatments for gypsy moth infestations is given in the Plant Protection Act of 2000 (7 U.S.C. section 7701 et.seq.).

The Cooperative Forestry Assistance Act of 1978 provides the authority for the USDA and state cooperation in management of forest insects and diseases. The law recognizes that the nation’s capacity to produce renewable forest resources is significantly dependent on non-federal forestland. The 2002 Farm Bill (P.L. 107-171d.) reauthorizes the basic charter of the Cooperative Forestry Assistance Act of 1978.

The National Environmental Policy Act (NEPA) of 1969 (P.L. 91-190), 42 USC 4321 et.seq. requires a detailed environmental analysis of any proposed federal action that may affect the human environment. The courts regard federally funded state actions as federal actions.
The Federal Insecticide, Fungicide and Rodenticide Act of 1947, (7 USC 136) as amended, known as FIFRA, requires insecticides used within the United States be registered by the United States Environmental Protection Agency (EPA).

Section 7 of the Endangered Species Act prohibits federal actions from jeopardizing the continued existence of federally listed threatened or endangered species or adversely affecting critical habitat of such species.

Section 106 of the National Historical Preservation Act and 36 CFR Part 800: Protection of Historic Properties requires the State Historic Preservation Officer be consulted regarding the proposed activities.

USDA Departmental Gypsy Moth Policy (USDA 1990) assigns the USFS and APHIS responsibility to assist states in protecting non-federal lands from gypsy moth damage.
2.0  ALTERNATIVES INCLUDING THE PROPOSED ACTION

2.1  Process Used to Formulate the Alternatives

Staff entomologists and administration within the IDNR, Division of Entomology and Plant Pathology and the Division of Forestry in cooperation with USDA-APHIS, formulated several alternatives to treat the gypsy moth populations in Indiana under the eradication strategy (See Chapter 6, Persons and Agencies Consulted).

The FEIS (USDA 1995), which this document is tiered to, allows the USDA to participate in the Cooperative Gypsy Moth Project for Indiana. The USDA can assist in conducting eradication, slow-the-spread and suppression strategies. The FEIS lists the treatment options for each of the strategies (USDA 1995, Vol. II, p.2-15). For the eradication strategy, the following six treatment options may be considered: 1) *Bacillus thuringiensis* var. *kurstaki* (Btk), 2) diflubenzuron (Dimilin), 3) nucleopolyhedrosis virus (Gypchek), 4) mass trapping, 5) mating disruption (pheromone flakes), and 6) sterile insect release. These treatment options from the FEIS were used as the alternatives for the site-specific analysis of this Environmental Assessment.

2.2  Alternatives Eliminated from Detailed Study

The following alternatives that are available were eliminated from consideration:

**Diflubenzuron (Dimilin).** The label for diflubenzuron (Dimilin) prohibits its use directly to water, or to areas where surface water is present. The treatment site contains a creek and also ditches areas that periodically may contain water. Therefore, its use was not considered for this project. This does not preclude the consideration and use of Dimilin in future projects.

**Gypsy moth specific nucleopolyhedrosis virus (Gypchek).** Gypsy moth nucleopolyhedrosis virus (Gypchek) has a very limited supply and is targeted for use in special areas that have high environmental concerns. There are limited data on the effectiveness of Gypchek in low-level gypsy moth populations. It is preferably used in suppression projects against moderate to high gypsy moth populations (USDA 1995, Vol. II, p. A7). Therefore, NPV is not considered for this project. In future projects, it will be evaluated for use.

**Sterile insect release.** The FEIS documents the use of sterile insects for elimination of isolated gypsy moth populations. It also documents the obstacles of using this alternative - the limited release period; need to synchronize production of sterile pupae and release into the population; and the limited availability. This treatment alternative is currently not available, and it has not been used in recent eradication or slow-the-spread treatment projects. Giving consideration to these obstacles, this alternative was not considered for this project. In future projects, it will be evaluated for use.
2.3 Alternatives Considered in Detail

**Alternative 1 - No action.** If no action is taken, the gypsy moth will reproduce and populations will begin to defoliate trees in the area. Gypsy moth populations will develop and spread to surrounding areas. This is not a preferred alternative because damage and regulatory action will occur sooner than if other alternatives are selected.

**Alternative 2 – Btk (Preferred Alternative).** This treatment option uses up to three applications of Btk at 24 to 38 billion international units (BIU) per acre applied from air or ground. The applications would begin when leaf expansion is near 50% and when first and second instar caterpillars are present and feeding. This usually occurs between mid April and mid May in central Indiana. The second application would follow no sooner than four days after the first application. Most commercial formulations of Btk are aqueous flowable suspension containing 48 or 76 BIU/gal. (Appendix D – example of product label). For aerial application at 24 to 38 BIU, less than 3.0 quarts of the product would be applied per acre.

Btk has been a commonly used treatment option in Cooperative Gypsy Moth Projects in Indiana and other states. Btk is a naturally occurring soil-borne bacterium that is mass-produced and formulated into a commercial insecticide. The Btk strain is effective against caterpillars, including the gypsy moth caterpillar. Caterpillars ingest Btk while eating the foliage. Once in the midgut, Btk becomes active and causes death within a few hours or days (USDA 1995, Vol. II, p. A3-A5). Btk may impact nontarget species of spring-feeding caterpillars in the treatment sites, but the impact to the local population is usually very minimal as Btk rapidly degrades on the foliage within a few weeks, and the nontarget lepidopterans generally re-colonize treatment sites in less than 2 years (USDA 1995, Vol. II, p. 4-52 to 4-55). Human exposure to Btk provides little cause for concern, though direct exposure to the spray may cause temporary eye and respiratory tract irritation in a few people (USDA 1995, Vol. II, p. 4-13).

Btk has proven effective at eliminating gypsy moth at all population levels. Btk applications can meet the project objective of eliminating gypsy moth populations from the proposed treatment site.

**Alternative 3 - Mating disruption.** This treatment option uses one aerial application of pheromone flakes prior to the emergence of male moths. This would occur in mid-June to early July. Mating disruption relies on the attractive characteristics of the gypsy moth sex pheromone, disparlure. The objective of mating disruption is to saturate the treatment area with enough pheromone sources to confuse the male moths and prevent them from finding and mating with female moths. Mating disruption is considered specific to gypsy moth and is not known to cause impacts to nontarget organism populations, water quality, microclimate, or soil productivity and fertility (USDA 1995, Vol. II, p. 4-67).

Mating disruption involves the aerial application of plastic flake dispensers that are impregnated with the gypsy moth pheromone. The formulation of Disrupt II (see
Appendix D – example of product labels) consists of small plastic flakes, approximately 1/32 inch x 3/32 inch (1 x 3 mm) in size, thus the name “pheromone flakes”. A sticker, Monsanto’s Gelva 2333, is applied to the flakes as they are dispersed from the aircraft, which aids in the distribution of the flakes throughout all levels in the forest canopy where mating could potentially occur. The flakes are green in color and applied at a rate of 6 or 15 grams active ingredient (disparlure) per acre. At the high rate of 15 grams, 85 grams of flakes are applied in 4 fluid ounces of sticker per acre (4 flakes per sq.ft.) (Reardon et al. 1998). All of the ingredients in the Gelva 2333 sticker are considered non-hazardous to public health if used as an additive in the insecticide formulation (40 CFR 180.1001).

Pheromone flakes have proven effective at eliminating gypsy moth at very low population levels. The application of pheromone flakes can not meet the project objective of eliminating gypsy moth populations from the proposed treatment site as the site has a low population level of gypsy moth.

**Alternative 4 - Mass trapping.** This treatment option places gypsy moth traps at a close spacing within the treatment sites. “The objective of this treatment is to capture male gypsy moths before they have a chance to locate and mate with female moths” (USDA 1995, Vol II, p. A-7). “For mass trapping, delta or milk carton traps are deployed in an intensive grid pattern in an infested area and an adjacent buffer area at the rate of at least 9 traps per acre” (USDA 1995, Vol. II, p. A-8). Thus, it is very labor intensive, especially over large areas. Typically, mass trapping is used on small infestations of less than 40 acres.

Mass trapping has proven capable of eradicating gypsy moth at very low population levels in isolated introductions that are small in size (<40 acres). The use of mass trapping can not meet the project objective of eliminating the gypsy moth population from the proposed treatment site as the site is >40 acres and there is a low level population.

3.0 AFFECTED ENVIRONMENT

3.1 Description of the Proposed Treatment Sites

**Delaware County:** There are approximately 263,600 acres in Delaware County and 13,200 acres of forest that contain both favorable and unfavorable host species.

**Nebo:** The proposed treatment site contains 299 acres. The site is primarily urban forests and trees associated with urban residential areas and adjacent farmland. The forest contains oak, hickory, maple, ash, conifers, shrubs and other hardwoods. Houses are within the site and there is an electrical substation and radio tower adjacent to the site. The site was detected in 2006 and survey detected egg masses. The survey indicates a low level gypsy moth population, and Btk is proposed for the site because the population is above the threshold for application of mating disruption and mass trapping.

3.2 Threatened and Endangered Species

Consultation with the staff of the U.S. Fish and Wildlife Service determined that neither of the federally endangered species Karner blue butterfly (*Lycaeides melissa samuelis*) and Mitchell’s satyr butterfly (*Neonympha mitchelii*) are known to occur within nor adjacent to the site proposed for treatment using Btk. (Appendix C – U.S. Fish & Wildlife Letter).

The treatment sites are within the range of the federally endangered Indiana bat (*Myotis sodalis*), and federally threatened bald eagle (*Haliaeetus leucocephalus*). The U.S. Fish & Wildlife does “not anticipate adverse effects on bald eagles from any treatments at this time, because this species is not directly affected by any of the treatments and its forage base consists mainly of vertebrates.” For Indiana bat, the proposed treatment site is not near hibernacula. The proposed aerial treatment is limited to a relatively small area of Indiana bat summer habitat. The U.S. Fish & Wildlife indicates the “link between loss of a lepidopteran forage base for Indiana bats and adverse effects on the species is uncertain, therefore at this time we consider the likelihood of take to be discountably small. However, to minimize impacts on foraging Indiana bats we recommend that aerial spraying at the listed sites above be conducted as early as possible in the season.” The U.S. Fish & Wildlife “concludes that the federally assisted 2007 gypsy moth program is not likely to adversely affect any of these federally listed species, …”(Appendix C – U.S. Fish & Wildlife Letter).

The IDNR, Environmental Unit reviewed the project. At this time, no harm to state or federal listed species, resulting from the proposed control measures, is known or anticipated. The potential harm from the project is less than the potential harm to these same species from an uncontrolled gypsy moth infestation.” (Appendix C – IDNR, Early Coordination/Environmental Assessment).
3.3 Protection of Historic Properties

The State Historic Preservation Officer analyzed the proposed project and determined that no historic properties will be altered, demolished, or removed by the proposed project. (Appendix C –IDNR Letter Division of Historic Preservation and Archaeology).

4.0 ENVIRONMENTAL CONSEQUENCES

This section is the scientific and analytic basis for the comparison of alternatives. It describes the probable consequences (effects) of each alternative for each issue. Environmental consequences are summarized in Table 2 for each combination of the alternatives and issues.

4.1 Human Health and Safety (Issue 1).

**Alternative 1 – No action.** For this alternative, there would be no cooperative project, therefore risk of human contact with pheromone flakes or Btk and an aircraft accident during application would not exist. However, future impacts by gypsy moth to human health will occur sooner under Alternative 1 than if treatments are used to eliminate the gypsy moth populations. Gypsy moth outbreaks have been associated with adverse human health effects, including skin lesions, eye irritation, and respiratory reactions. Gypsy moth caterpillars can become a serious nuisance that can cause psychological stress in some individuals (USDA 1995, Vol. II, p. 4-9).

**Alternative 2 - Btk.** Human exposure to Btk provides little cause for concern about health effects. “On the basis of both the available epidemiology studies as well as the long history of use, no hazard has been identified for members of the general public exposed to Btk formulations” (USDA 1995, Vol. III, p. 4-15). Exposure to Btk may result in temporary eye, skin, and respiratory tract irritation in a few people. A detailed analysis of the risks posed to humans by Btk was conducted for the FEIS -- Human Health Risk Assessment (USDA 1995, Vol. III). Glare and O’Callaghan provide a comprehensive review of *Bacillus thuringiensis*, including Btk. They conclude with this statement, “After covering this vast amount of literature, our view is a qualified verdict of safe to use.” (Glare and O’Callaghan, 2000)

A slight risk of an accident always exists when conducting aerial applications – Btk uses two applications. To further reduce this risk, a detailed work and safety plan is required prior to program implementation, which outlines guidelines for aircraft inspections, Btk loading, and conditions for safe applications. The effect of gypsy moth outbreaks on humans would be delayed using this alternative.

**Alternative 3 – Mating disruption.** The toxicity of insect pheromones to mammals is relatively low and their activity is target-specific. Therefore the EPA requires less rigorous testing of these products than of conventional insecticides. Risk to human health due to exposure to disparlure, the active ingredient in pheromone flakes, is discussed in the FEIS (USDA 1995, Vol. II, pp. 4-30 to 4-32). Once absorbed through direct contact,
disparlure is very persistent in humans, and individuals exposed to disparlure may attract adult male moths for prolonged periods of time. This persistence is viewed as a nuisance and not a health risk (USDA 1995, Vol. III, 8-1). In acute toxicity tests, disparlure was not toxic to mammals, birds, or fish (USDA 1995, Vol. IV, 5-5) therefore no effects to human health are anticipated.

A slight risk of an accident always exists when conducting aerial applications – mating disruption uses one application. To further reduce this risk, a detailed work and safety plan is required prior to program implementation, which outlines guidelines for aircraft inspections, pheromone flake loading, and conditions for safe applications. The effect of gypsy moth outbreaks on humans would be delayed using this alternative.

**Alternative 4 – Mass trapping.** The human health effects are not anticipated from the use of disparlure in the delta traps (see Alternative 3 above). The effect of gypsy moth outbreaks on humans would be delayed using this alternative.

4.2 Effects on Non target Organisms and Environmental Quality (Issue 2).

**Alternative 1 – No action.** With no treatments in the current year, future impacts by the gypsy moth would occur sooner. Defoliation by the gypsy moth will cause selective mortality of preferred host trees. During outbreaks, forest ecosystems can change due to a reduction of the oak component and an increase of tree species that are less desired by gypsy moth, such as maple and ash. Oak forests would likely consist of a more mixed composition in the future; though oak would still be a component.

Gypsy moth defoliation and subsequent tree mortality can affect non target organisms by dramatically changing habitats on a local scale. Heavy defoliation can remove food for other leaf-feeding species, including other caterpillars. However, it can also create new habitat for some species by creating snags and increasing understory plant development by increasing light penetration into defoliated areas. Impacts on a larger scale (national, regional, or state) are subtle, gradual, and may be noticeable only after many years or decades (USDA 1995, Vol. II, p. 4-74). Short- and long-term changes in non target species have been shown for moderate and heavy defoliation (USDA 1995, Vol. II, p. 4-47 and 4-50). An Ecological Risk Assessment (USDA 1995, Vol. IV) examined gypsy moth impacts on a wide variety of species (mammals, birds, reptiles, amphibians, fish, insects, mollusks, crustaceans, and other invertebrates). Further discussion of gypsy moth and its impact on forest conditions can be found in the FEIS (USDA 1995, Vol. II, p. 4-41 and 4-74).

**Alternative 2 - Btk.** Btk can have direct and indirect effects on non target organisms. Direct toxicity of BT is generally limited to the larval stage of moth and butterfly species. BT is not toxic to vertebrates, honeybees, parasitic and predatory insects, and most aquatic invertebrates (USDA 1995, Vol. IV, p. 5-1). BT has a direct adverse effect on caterpillars of moths and butterflies, but susceptibility varies widely among species. BT, as used in gypsy moth projects, poses a risk to some spring-feeding caterpillars; however, permanent changes in their populations do not appear likely. An exception may occur in
certain habitats that support small isolated populations of a particular species of moth or butterfly that is highly susceptible to BT (USDA 1995, Vol. II, p. 4-54). The U.S. Fish and Wildlife Service identified two federally endangered butterflies - Karen blue butterfly (*Glycosides Melissa Samuels*) and the Mitchell’s satyr butterfly (*Neonympha mitchellii*). However, these species are not known to occur within or adjacent to the treatment site (Appendix C - U.S. Fish & Wildlife Letter). Thus, no potential exists for Btk to affect these populations.

Btk may have an indirect effect on other organisms by a reduction in their food resource (e.g. caterpillars, pupae, or adult moths and butterflies). Any effects on vertebrates due to reduction in food availability are probably subtle, especially for mammals and birds that are very mobile. Populations of some gypsy moth parasites and some general lepidopteran parasites may be reduced, due to the reduction in number of potential hosts caused by the Btk spray (USDA 1995, Vol. IV, p. 5-7). The U.S. Fish and Wildlife letter identified that the treatment site is within the range of the federally endangered Indiana bat (*Myotis sodalis*), and the federally threatened bald eagle (*Haliaeetus leucocephalus*). They “do not anticipate adverse effects on bald eagles from any treatments at this time, because this species is not directly affected by any of the treatments and its forage base consists mainly of vertebrates.” For Indiana bat, “none of the proposed treatment areas are near Indiana bat hibernacula.” The U.S. Fish and Wildlife letter indicates that the proposed treatment site is limited to relatively small areas of Indiana bat summer habitat. The U.S. Fish & Wildlife indicates the “link between loss of a lepidopteran forage base for Indiana bats and adverse effects on the species is uncertain, therefore at this time we consider the likelihood of take to be discountably small. However, to minimize impacts on foraging Indiana bats we recommend that aerial spraying at the listed site above be conducted as early as possible in the season.” The U.S. Fish & Wildlife “concludes that the federally assisted 2007 gypsy moth program is not likely to adversely affect any of these federally listed species, …” (Appendix C – U.S. Fish & Wildlife Letter).

Applications of Btk formulations do not increase levels of Btk in soil, and Btk persists for a relatively short time in the environment. Changes in soil productivity and fertility are not likely in the treatment sites, because Btk occurs naturally in soils worldwide. Additional information concerning the effects to soil can be found in Appendix G of the FEIS (USDA 1995, Vol. IV).

Application of Btk is likely to maintain the forest condition in the short-term by eliminating gypsy moth populations in the treatment sites, thus delaying gypsy moth from expanding and causing defoliation. In the long-term, gypsy moth will become well established in the county; even if this alternative is implemented.

**Alternative 3 – Mating disruption.** The pheromone in the flake dispenser is specific to gypsy moth, and it will not affect other insects, including any threatened and endangered species of butterflies or moths.

A quantitative assessment of risk from mating disruption was not conducted for the FEIS because of disparlure’s low toxicity to vertebrates and specificity to gypsy moth. As used
in mating disruption, disparlure is not likely to impact nontarget organisms (USDA 1995, Vol. II, p. 4-67). The toxicity of insect pheromones to mammals is relatively low. In acute toxicity tests, disparlure was not toxic to mammals, birds, or fish (USDA 1995, Vol. IV, 5-5). At normal application rates, concentration of the pheromone (disparlure) impregnated in the flakes remains active for one season only. Therefore, no effects on non target organisms are anticipated from the proposed Disrupt II application.

Most ingredients in the flakes are insoluble in water, so the risk of disparlure leaching into groundwater is minimal. To determine the amount of disparlure that could potentially leach into water, 50 grams of flakes were submerged in 150 ml of water and vigorously agitated for 24 hours. Results indicate that less than 0.04% of the active ingredient (disparlure) contained in the flakes leached into water under these conditions. Disrupt II is applied at doses of 6 or 15 grams of active ingredient (disparlure) per acre and 90% of the flakes are intercepted by and adhere to the forest canopy, where they remain until they have released most of the disparlure.

Using pheromone flakes to disrupt mating is likely to maintain the forest condition in the short-term by eliminating gypsy moth populations in the treatment sites, thus delaying gypsy moth from expanding and causing defoliation. In the long-term, gypsy moth will become well established in the county; even if this alternative is implemented.

Alternative 4 - Mass trapping. The pheromone in the delta trap is specific to gypsy moth and will not have an effect on other insects or threatened and endangered species of butterflies or moths. “Mass trapping does not affect nontarget organisms, except those (primarily flying insects) that accidentally find their way into the trap.” (USDA 1995, Vol. II, p. A-9).

Mass trapping is likely to maintain the forest condition in the short-term by eliminating gypsy moth populations in the treatment sites, thus delaying gypsy moth from expanding and causing defoliation. In the long-term, gypsy moth will become well established in the county; even if this alternative is implemented.

4.3 Economic and Political Impacts of Treatment vs. Non-Treatment (Issue 3).

Alternative 1 – No action. If no treatments were applied, the likely action would be to implement a quarantine in the county during the next year. A quarantine would regulate movement of firewood, logs, other timber products, mobile homes, recreational vehicles, trees, shrubs, Christmas trees, and outdoor household articles. This would create a financial impact to industries that deal with these products.

If current populations are not treated, they will continue to reproduce and grow in size. Defoliation would become noticeable in the future, but it would be difficult to predict exactly when noticeable defoliation would occur. Requests for federal assistance to suppress gypsy moth would be likely when defoliation occurs. Suppression projects are generally more expensive in total dollars than eradication projects because much larger
areas are treated. The economic impact to state budgets would increase, as responsible agencies would need to administer and fund these suppression projects.

Following defoliation, negative financial impacts are likely to occur for recreational industries such as resorts and campgrounds. Homeowners, private woodland owners, and forest-based industries could be impacted by gypsy moth treatment costs, tree mortality, and adverse human health effects.

**Alternatives 2 (Btk).** If treatments are applied, regulatory action is not likely for the county during the next year and the impacts listed under Alternative 1 would be delayed.

**Alternatives 3 (Mating disruption).** If treatments are applied, regulatory action is not likely for the county during the next year and the impacts listed under Alternative 1 would be delayed.

**Alternative 4 – Mass trapping.** If treatments are applied, regulatory action is not likely for the county during the next year and the impacts listed under Alternative 1 would be delayed. Mass trapping is typically used in small areas (less than 40 acres) because it is labor intensive (USDA 1995, Vol. II, p. A8-9). Its use for this treatment site would be cost prohibitive.

## 4.4 Likelihood of Success of the Project (Issue 4).

**Alternative 1 – No action.** Project objectives would not be met with this alternative. Gypsy moth would not be eliminated from the treatment site, and its population would serve as a source for increased spread within the county and into surrounding counties. If the populations were allowed to increase and expand, gypsy moth could spread through the remainder of the state in <10 years (Sharov et al. 2002).

**Alternative 2 - Btk.** Project success is likely with this alternative. Btk is effective in eliminating gypsy moth in treatment sites with low gypsy moth populations.

**Alternative 3 – Mating disruption.** Project success is likely with this alternative in sites with very low population levels. However, this site has a low gypsy moth population level and an application of pheromone flakes cannot meet the objective of eliminating the population from the proposed treatment site.

**Alternative 4 – Mass trapping.** Project success is likely with this alternative in sites with very low population levels. However, this site has a low gypsy moth population level. Mass trapping is a labor-intensive treatment and sites greater than 40 acres are usually not mass trapped. Mass trapping this site would be cost prohibitive.
4.5 Unavoidable Adverse Effects

No unavoidable adverse effects were identified for the proposed project.

4.6 Irreversible and Irretrievable Commitments of Resources

An irreversible commitment of resources results in the permanent loss of: 1) nonrenewable resources, such as minerals or cultural resources; 2) resources that are renewable only over long periods of time, such as soil productivity; or 3) a species (extinction) (USDA 1995, Vol. II, p. 4-93). Except for Alternative 1, there is an irreversible commitment of labor, fossil fuel, and money spent on the project.

An irretrievable commitment is one in which a resource product or use is lost for a period of time while managing for another (USDA 1995, Vol. II, p. 4-93). For this project, no irretrievable commitments were identified.

4.7 Cumulative Effects

No cumulative effects were identified for this proposed project. Cumulative effects are the incremental impacts of the action when added to past, present, and reasonably foreseeable future actions that collectively are significant.

The site has not been treated in previous years. No cumulative effects of this treatment and the proposed treatment are anticipated.

4.8 Other Information

Mitigation

The Cooperative Gypsy Moth Project will implement the following safeguards and mitigating measures:
- News releases of treatments and dates will be given to local newspapers and radio/TV stations.
- Local safety authority will be notified by direct contact or phone calls.
- Employees of state and federal agencies monitoring the treatment will receive training on treatment methods to be able to answer questions from the public.
- Application of Btk will be suspended when school buses are in the site and when children are outside on school grounds.
- Aircraft will be calibrated for accurate application of treatment material.
- Applications will be timed so the most susceptible gypsy moth stage is targeted.
- Weather will be monitored during treatment to assure accurate deposition of the treatment material.
Monitoring

During the treatments, ground observers and/or aerial observers will monitor the application for accuracy within the block perimeters, swath width, and drift. Application information (e.g. swath widths, spray-on and spray-off, acres treated, and altitude) will be downloaded to an operations-base computer.

The treatment site will be monitored using gypsy moth traps to determine the effectiveness of the treatments.
5.0 LIST OF PREPARERS

Phil Marshall, Managing State Entomologist and Forest Health Specialist, Division of Entomology and Plant Pathology and Division of Forestry (respectfully), Indiana Department of Natural Resources, 402 W. Washington Street, Room 290/296W, Indianapolis, IN 46204.
EA Responsibility: Participated in writing and reviewing the environmental assessment and in the development of the proposed cooperative gypsy moth project.
Experience and Education: Experience as Forest Health Specialist since 1974 and experience in gypsy moth management since 1977. M.F., Duke University in Forest Entomology and Pathology; B.A., Catawba College in pre-forestry.

Angela Rust, SW Nursery Inspector and Compliance Officer, Division of Entomology and Plant Pathology, Indiana Department of Natural Resources, 145 24th Street, Tell City, Indiana 47586.
EA Responsibility: Participated in writing and reviewing the environmental assessment and in consultation of the proposed cooperative gypsy moth project.
Experience and Education: Nursery Inspector and Compliance Officer with the Indiana Department of Natural Resources, Division of Entomology and Plant Pathology since 1995. B.S., Purdue University in Entomology.

APPENDIX A. ISSUES, QUESTIONS AND CONCERNS FROM THE PUBLIC MEETING

At the public meeting (Table 1), representatives from the Division of Entomology and Plant Pathology presented the proposed gypsy moth project, and answered questions and received comments. The presentation explained:

- the life cycle, feeding habits and hosts of gypsy moth,
- the identification of gypsy moth,
- survey methods,
- gypsy moth impacts and damage to the trees and forest,
- selection of proposed sites,
- selection of the treatment options,
- the timing and application of treatments,
- boundaries of the treatment sites with maps and photos.

Following the presentation and during the presentation, questions and comments were taken, answered and discussed with the people attending the meeting.

Table 1: Date, time and attendance of the Public Meeting for the proposed treatment site.

SUMMARY OF QUESTIONS AND COMMENTS

The response from the public meeting was positive. There were no negative comments expressed. The questions and comments received at the public meetings concerned four main issues:

- Human health and safety;
- Non target effects and environmental effects;
- Economic and political impacts;
- Likelihood of success of the proposed project and the treatment options proposed.

ISSUES

Human Health and Safety

Two questions were asked in the area of human health and safety, regarding if there had been any documented harmful effects on young children and when the public would be notified of the actual treatment. The response explained that there have not been any known documented indications of harmful effects to children or the general public, but if people are concerned we recommend that they keep their children inside during
treatments. It was stated that the public would be notified of the treatment with a letter and also through the local media.

**Non target and Environmental Effects**

One question was asked if animals or household pets needed to be kept inside during treatments. It was responded that Btk. is not toxic to humans, mammals, birds or fish and that keeping animals inside during treatments is up to the individual homeowner.

**Economic and Political Impacts**

It was asked if the decision to treat this proposed site was already finalized and it was responded that the decision to proceed or not proceed would not be decided until after we have received public comments.

The question was asked if the treatment did not occur: how long would it be before they would likely see negative effects? It was stated that negative effects could possibly be seen as soon as a couple years, since non-treatment of the site would allow gypsy moth populations to increase and spread out over a larger area.

One resident commented that they would like to see the proposed treatment proceed, and that they were disappointed with the low turn out for the meeting by residents.

**Likelihood of Success of the proposed project and the proposed treatment options**

Two questions were asked regarding how rain affects the treatment and if rain occurred, would we have to go back and treat again. It was stated that if rain occurs 6-8 hours after the treatment, it would not likely have a negative impact on the effectiveness of the treatment. However, it is possible to have to retreat a site due to weather conditions that occur soon after a treatment has been applied.

**Other Questions or Concerns**

Several general questions were asked regarding the different life stages of Gypsy Moth, the trapping survey already done in the area and also on what post treatment survey would done.

It was explained that the male and female moths are of different sizes and that the pupa stage can be attached to anything that remains outside; including trees, buildings and vehicles. It was also restated that Gypsy Moths are not native to the United States. The traps used in our state survey are made of cardboard and the area surrounding the proposed treatment site; as well as the entire state, was surveyed. The proposed site is the only site being proposed for treatment in Delaware County and it was stated that the treatment would occur in the spring at the time we see larvae hatch from egg masses within the proposed site. A follow up trapping survey will be done within and around the proposed treatment site. It is not clear how Gypsy Moth arrived to the area.

Mr. Robert Waltz
Indiana DNR, Division of Entomology and Plant Pathology
402 West Washington Street, Room 290
Indianapolis, Indiana 46204

Dear Mr. Waltz:

The U.S. Fish and Wildlife Service (FWS) has reviewed your letter of December 15, 2006 regarding the 2007 gypsy moth treatment program for 22 sites in 6 Indiana counties (Allen, Delaware, Elkhart, Marshall, Porter, Whitley). We are submitting the following comments on the 2007 program.

These comments have been prepared under the authority of the Fish and Wildlife Coordination Act (16 U.S.C. 661 et. seq.) and are consistent with the intent of the National Environmental Policy Act of 1969, the Endangered Species Act of 1973, and the U. S. Fish and Wildlife Service's Mitigation Policy.

The plan submitted in your letter includes aerial spraying of mating disruption pheromone flakes (Disrupt II) at 3 sites (22,786 acres), aerial spraying of Bacillus thuringiensis biological control (Btk) at 13 sites (7620 acres), all with federal funding assistance. Additionally, ground application of Dimilin to selected trees is proposed at 6 sites. Dimilin application in 2007 is a State of Indiana action with no federal funding assistance.

Endangered butterflies

One of the proposed treatment methods, spraying with Bacillus thuringiensis (Bt), is of concern for 2 federally endangered species of Lepidoptera in Indiana, the Karner blue butterfly (L. v. melissa samuelis) and Mitchell's saty butterfly (Neonympha mitchelli). The known occurrences of these 2 endangered species are in the northern portions of Lake and Porter Counties (Karner blue butterfly), and isolated locations in LaPorte and LaGrange Counties (Mitchell's saty). The range of these species has not changed since our review of the 2006 gypsy moth program. Neither species is known to occur within or adjacent to the Btk sites identified in your letter, however the Willow Creek Btk treatment site in Porter County (765 acres) is within a mile of the Karner blue butterfly population in and around the Indiana Dunes National Lakeshore (IDNL). It is imperative that aerial spraying of Btk at the Willow Creek site be conducted in a manner that
will avoid any drift into the Karner blue butterfly population areas. IDNL staff can provide more information on the specific areas of concern. Treatment with Disrupt II pheromone flakes, which is considered to be highly specific for gypsy moths, will have no adverse impacts on the federally listed butterflies.

All of the Dimilin treatment sites (which are not federal actions and are therefore not subject to Section 7 of the Endangered Species Act) are limited to very small areas with application limited to selected trees and are not near any current endangered species occurrence records. Federally listed butterflies are not present at any of those sites.

Other Endangered Species

The proposed treatment sites are within the range of the federally endangered Indiana bat (Myotis sodalis), and federally threatened bald eagle (Haliaeetus leucocephalus). We do not anticipate adverse effects on bald eagles from any treatments at this time, because this species is not directly affected by any of the treatments and its forage base consists mainly of vertebrates.

Indiana bats hibernate in caves, then disperse to reproduce and forage in relatively undisturbed forested areas associated with water resources during spring and summer. Young are raised in nursery colony roosts in trees, typically near drainageways in undeveloped areas. Prior to hibernation, Indiana bats feed intensively in forested areas near hibernacula in order to build up adequate fat reserves to survive hibernation.

The diet of Indiana bats consists entirely of insects. Based on previous studies they appear to be somewhat opportunistic feeders. Some studies have found lepidopterans as a major dietary component, while others found a diet dominated by terrestrial Coleoptera or aquatic insects. Most of these studies were essentially "snapshots" and there is a lack of comprehensive, long-term research. It is possible that under some circumstances extensive elimination of a broad range of lepidopteran species over a large habitat area has the potential to adversely affect the food base of an Indiana bat nursery colony. This concern increases greatly with the use of Dimilin because it kills a much broader range of insects. None of the proposed treatment areas are near Indiana bat hibernacula. Most of the 2007 Btk aerial treatment sites are limited to relatively small areas of Indiana bat summer habitat, however based upon the aerial photos you provided we identified 2 sites where a substantial amount of suitable forested summer habitat occurs within an aerial treatment area. These sites are listed below in descending size of affected forest:

1. Hathaway site (Allen County, 1404 acre treatment area), 500 acres of forest (our estimate).

2. Willow Creek site (Porter County 765 acre treatment area), 150 acres of forest (our estimate).

The link between loss of a lepidopteran forage base for Indiana bats and adverse effects on the species is uncertain, therefore at this time we consider the likelihood of take to be discountably small. However, to minimize impacts on foraging Indiana bats we recommend that aerial spraying at the sites listed above be conducted as early as possible in the season. The Indiana bat
summer occupancy season is considered to begin in mid-April, probably slightly later in northern Indiana.

The FWS concludes that the federally assisted 2007 gypsy moth program is not likely to adversely affect any of these federally listed species, subject to the aforementioned concern about avoiding Beek drifl toward the karner blue butterfly. If future federally-assisted programs incorporate large scale application of Dimilin, or propose BT aerial application over very large areas of Indiana but summer or winter habitat, this issue will have to be reevaluated.

This precludes the need for further consultation on this project as required under Section 7 of the Endangered Species Act of 1973, as amended. If, however, new information on endangered species at the site becomes available or if project plans are changed significantly, please contact our office for further consultation.

For further discussion, please contact Mike Litwin at (812) 334-4261 ext. 205.

Sincerely yours,

Scott E. Pruitt
Field Supervisor

Re: Gypsy moth eradication program for 2007

Dear Mr. Marshall:

Pursuant to Indiana Code 14-21-1-18 the Indiana Department of Natural Resources, Division of Historic Preservation and Archaeology ("DHPA") has conducted a review of the materials dated December 15, 2006, and received by the DHPA on December 21, 2006, for the above indicated project in Allen, Porter, Elkhart, Whitley, Delaware, and Marshall counties, Indiana.

Based on our analysis, it has been determined that no historic properties will be altered, demolished, or removed by the proposed project.

If you have any further questions regarding this determination, please contact Shana Kelso of the DHPA at (317) 232-5491 or skelso@dhr.in.gov.

Very truly yours,

Shana Kelso

Project: 2007 Proposed Gypsy Moth Treatment Sites

County/Site Info: Allen - Delaware - Elkhart - Marshall - Porter - Valparaiso Counties

The Indiana Department of Natural Resources has reviewed the above referenced project per your request. Our agency offers the following comments for your information and in accordance with the National Environmental Policy Act of 1969.

Regulatory Assessment: Formal approval by the Department of Natural Resources under the regulatory programme administered by the Division of Water is not required for this project.

Natural Heritage Database: The Natural Heritage Program's data have been checked.

Overall, the approach to using disruption pheromone flakes, as opposed to Btk or Din, in areas with natural habitat seems prudent. Although we have very little data on reptile/invertebrates species in these areas, we know from surveys in similar habitats elsewhere, that rare butterflies and moths do use these natural habitats.

Proposed treatment sites that will be treated using pheromone flakes, and that contain potentially sensitive habitat include Cedarville MD, Allen County. The 8.483 acre Cedarville MD treatment site embraces Meno-Ma Nature Preserve within Metea County Park and a segment of the state designated Cedar Creek Natural and Scenic River. We have some concerns for impacts to native lepidopterans at these locations, but have no documented occurrence of any rare species within these areas.

Fish & Wildlife Comments: The impacts of this gypsy moth control effort are impossible to predict. However, the devastating effects of uncontrolled gypsy moth infestations are well documented. Effects on non-target species are possible and care should be taken near areas that could possibly present endangered or threatened species, or species of concern. The effects on target species will depend on a variety of factors and are impossible to predict with certainty. However, controlling the spread of this species is important to reduce the negative effects the caterpillars have on trees, particularly oaks. At this time, no harm to state or federal listed species resulting from the proposed control measures is known or anticipated. The potential harm from the project is less than the potential harm to these same species from an uncontrolled gypsy moth infestation.

The US Fish and Wildlife Service will provide their own comments regarding the impacts to federally listed species, especially the Karner Blue (Lysandra melissa samuelis) and Mitchell's Satyr (Neomysia mitchelli mitchelli) butterflies that occur within counties to receive treatment.

In addition to the recommendations above, fish, wildlife, and botanical resource losses as a result of this project can be minimized through implementation of the following measures:

Ensure that Deltamethrin does not enter the waterway in order to prevent detrimental effects to aquatic species (e.g. crayfish and macroinvertebrates).

Time the application of Btk to minimize its effects on gypsy moth caterpillars.

APPENDIX D. EXAMPLE OF PRODUCT LABEL

Valent BioSciences

Foray® 76B
Biological Insecticide

Flowable Concentrate
For the control of Lepidopterous Larvae

ACTIVE INGREDIENT:
Bacillus thuringiensis subspecies kurstaki, strain
ATTS-351, fermentation solids and solubles ........................................... 18.46%
Other Ingredients: ...................................................................................... 81.54%

Total: 100.00%

Potency: 16,700 Cabbage Looper Units (CLU) per mg of product (equivalent to 76 billion CLUGAL).
The percent active ingredient does not indicate product performance and potency
measurements are not federally standardized.

EPA Reg. No. 73049-49
EPA Est. No. 33762-IA-001

KEEP OUT OF REACH OF CHILDREN

CAUTION
1.0 FIRST AID

If on skin or clothing
• Take off contaminated clothing.
• Rinse skin immediately with plenty of water for 15-20 minutes.
• Call a poison control center or doctor for treatment advice.

If in eyes
• Hold eyes open and rinse slowly and gently with water for 15-20 minutes.
• Remove contact lenses, if present, after first 5 minutes, then continue rinsing eye.
• Call a poison control center or doctor for treatment advice.

HOT LINE NUMBER

Have the product container with you when calling a poison control center or doctor, or
going for treatment. You may also contact 1-877-315-9819 for emergency medical
treatment and/or transport emergency information. For all other information, call
1-800-332-9977.

2.0 PRECAUTIONARY STATEMENTS

2.1 HAZARDS TO HUMANS AND DOMESTIC ANIMALS

CAUTION
Causes moderate eye irritation. Avoid contact with eyes, skin, or clothing. Wash
thoroughly with soap and water after handling.

2.2 Personal Protective Equipment (PPE)
Applicators and other handlers must wear:
• Long-sleeved shirt
• Long pants
• Waterproof gloves
• Shoes plus socks

2.3 Agricultural Use Requirements:
Mixers/loaders and applicators must wear a dust/mist filtering respirator meeting
NIOSH standards of at least N-95, R-95, or P-95. Repeated exposure to high con-
centrations of microbial proteins can cause allergic reactions. When handlers use
closed systems, enclosed cars, or aircraft in a manner that meets the requirements
listed in the Worker Protection Standard (WPS) for agricultural pesticides [40
CFR 170.240(d)(4)-(6)], the handler PPE requirements may be reduced or modified
as specified by the WPS.

2.4 Non-Agricultural Use Requirements:
Mixers/loaders and applicators in enclosed cabinets or aircraft must wear a dust/mist
filtering respirator meeting NIOSH standards of at least N-95, R-95, or P-95.
Repeated exposure to high concentrations of microbial proteins can cause allergic
sensitization.

2.5 User Safety Recommendations
Users should:
• Wash hands before eating, drinking, chewing gum, using tobacco or using the
  toilet.
• Remove clothing immediately if pesticide gets inside. Wash thoroughly and
  put on clean clothing.
• Remove PPE immediately after handling the product. Wash outside of gloves
  before removing. As soon as possible, wash thoroughly and change into clean
clothing.

Follow manufacturer’s instructions for cleaning/maintaining PPE. If no
instructions for washables, use detergent and hot water. Keep and wash separately from other laundry.

3.0 STORAGE AND DISPOSAL

Do not contaminate water, food or feed by storage or disposal of waste
Storage: Store in a cool, dry place. Keep containers tightly closed when not in use.
Store in temperatures above freezing and below 25°C (77°F).

Pesticide Disposal: Pesticide waste resulting from the use of this product
should be disposed of on site or at an approved waste disposal facility in accor-
dance with federal and local regulations.

Container Disposal: Triple rinse (or equivalent). Then offer for re-
conditioning or puncture and dispose of in a sanitary landfill or by inciner-
ation, if allowed by state and local authorities, by burning. If burned, see smoke.

4.0 DIRECTIONS FOR USE

It is a violation of Federal law to use this product in a manner inconsistent with labeling.
For any requirements specific to your State or Tribe, consult the responsible party for pesticide regulation.

Do not apply this product through any type of irrigation system.

5.0 AGRICULTURAL USE REQUIREMENTS

Use this product only in accordance with its labeling and with the Worker
Protection Standard, 40 CFR part 170. This Standard contains requirements for
worker protection of agricultural workers on farms, forests, nurseries, and the
growth and handling of agricultural pesticides. It contains requirements for train
contamination, notification, and emergency assistance. It also contains
instructions and exceptions pertaining to the statements on this label about
personal protective equipment (PPE) and restricted-entry interval. The requi-
test in this box only apply to uses of this product that are covered by the
Protection Standard.

Do not apply this product in a way that will contact workers or other
people, or enter drift. Only protected handlers may be in the area
application.

Do not enter or allow worker entry into treated areas during the restriction
interval (REI) of 4 hours.

PPE required for early entry to treated areas that is permitted under the Protection Standard and that involves contact with anything that has been
such as plants, soil, or water, is:
• Coveralls
• Waterproof gloves
• Shoes plus socks

6.0 APPLICATION

Foray 76B may be applied by ground or aerial equipment undiluted quantities of water sufficient to provide thorough coverage of plant
parts protected. The amount of water needed per acre will depend upon
soil, crop, and treatment conditions. Do not allow diluted mixture to remain
on for more than 72 hours.

The use of a spreader-sticker approved for use on growing crops is recog-
ized for hard to wet crops such as coix crops or to improve the wetness-fastness of
the product. Combinations with commonly used spray tank adjustments are
not deleterious to Foray 76B, if the mix is used promptly. Before mixing spray tank, it is advisable to test physical compatibility by mixing all lots
together in a small container in proportionate quantities.

7.0 MIXING

Shake or stir Foray 76B before use. Fill spray or mixing tank half full
of water. Begin agitation and pour Foray 76B into water while maintaining
agitation. Add other spray material (if any) and balance of water. A
necessary to maintain suspension. Do not allow diluted mixture to remain
in tank for more than 72 hours.

The use of a spreader-sticker approved for use on growing crops is recog-
ized for hard to wet crops such as coix crops or to improve the wetness-fastness of
the product. Combinations with commonly used spray tank adjustments are
not deleterious to Foray 76B, if the mix is used promptly. Before mixing
spray tank, it is advisable to test physical compatibility by mixing all lots
together in a small container in proportionate quantities.

8.0 SPRAY VOLUMES

Ground Application: Use recommended amount of Foray 76B in ground
mixtures with quantities of water sufficient to provide thorough coverage
parts to be protected. The amount of water needed per acre will depend
on crop size, weather conditions, spray equipment used, and local experience.

Aerial Application: Use recommended amount of Foray 76B in aerial
spray mixtures with quantities of water sufficient to provide thorough coverage
of plant parts to be protected. In the western US 5-10 gallons per acre is the
minimum; in the eastern region a minimum of 2-3 gallons is normally used.
The minimum amount of water needed per acre will depend upon crop size,
conditions, spray equipment used and local experience.

9.0 GENERAL AGRICULTURAL USE INSTRUCTIONS

Ground Application: Use recommended amount of Foray 76B in ground
mixtures with quantities of water sufficient to provide thorough coverage
parts to be protected. The amount of water needed per acre will depend
on crop size, weather conditions, spray equipment used, and local experience.

Aerial Application: Use recommended amount of Foray 76B in aerial
spray mixtures with quantities of water sufficient to provide thorough coverage
of plant parts to be protected. In the western US 5-10 gallons per acre is the
minimum; in the eastern region a minimum of 2-3 gallons is normally used.
The minimum amount of water needed per acre will depend upon crop size,
conditions, spray equipment used and local experience.

of plant parts to be protected. In the western US 5-10 gallons per acre is the
minimum; in the eastern region a minimum of 2-3 gallons is normally used.
The minimum amount of water needed per acre will depend upon crop size,
conditions, spray equipment used and local experience.
Foray 76B may be applied up to and on the day of harvest. For maximum effectiveness the following is recommended:

Monitor fields to detect early infestations.

Apply Foray 76B when eggs start hatching and larvae are small (early instars) and before significant crop damage occurs. Larvae must be actively feeding to be affected.

Repeat applications every 3 to 14 days to maintain control and protect new plant growth. Factors affecting spray interval include rate of plant growth, weather conditions, and population densities. Monitor populations of pests and beneficials to determine proper timing of applications.

Under conditions of heavy pest pressure or when large worms are present use the higher rate, shorten the application interval, and/or improve spray coverage to enhance control. When these conditions are present, a contact insecticide should be used to enhance control.

Thorough coverage is essential for optimum performance. Ground applicators equipped with directed drop nozzles can improve coverage.

### Special Instructions

1Use the higher recommended rates on advanced larval stages or under high density larval populations.

2In treating gypsy moth infested trees and shrubs in urban, rural, and semi-rural areas, exposure of non-target vegetation including, but not limited to, native and ornamental species and food or feed crops is permitted.

## 11.0 DIRECTIONS FOR USE FOR NON-AGRICULTURAL APPLICATIONS

### 11.1 NON-AGRICULTURAL USE REQUIREMENTS

The requirements in this box apply to uses that are NOT within the scope of the Worker Protection Standard for agricultural pesticides (40 CFR Part 170). The WPS applies when this product is used to produce agricultural plants on farms, forests, nurseries or greenhouses. Keep unprotected persons out of the treated areas until sprays have dried.

Avoiding spray drift at the application site is the responsibility of the applicator. The interaction of many equipment- and weather-related factors determine the potential for spray drift. The applicator and the grower/treatment coordinator are responsible for considering all of these factors when making decisions. It is a violation of Federal law to use this product in a manner inconsistent with its labeling. For any requirements specific to your State or Tribe, consult the agency responsible for pesticides regulation.

Not for use on plants being grown for sale or other commercial use, or for commercial seed production, or for research purposes. For use on plants intended for aesthetic purposes or climatic modification and being grown in interior plantscapen, ornamental gardens or parks, or on golf courses or lawns and grounds. Not for use on trees being grown for sale or other commercial use, or for commercial seed production, or for the production of timber or wood products, or for research purposes except for wide-area public pest control programs sponsored by government entities, such as mosquito abatement, gypsy moth control, and Mediterranean fruit fly eradication.

Do not apply this product through any type of irrigation system.

Foray 76B contains the spores and conidiaux crystals of Bacillus thuringiensis kurstaki. Foray 76B is a stomach poison and is effective against lepidopterous larvae. After ingestion, larvae stop feeding within hours and die 2-5 days later. Maximum activity is exhibited against early instar larvae. Foray 76B may be used for both ground and aerial application. The product should be awakened or stirred before use. Add some water to the tank mix, pour the recommended amount of Foray 76B into the tank and then add the remaining amount of water to obtain the proper mix ratio. Agitate as necessary to maintain the suspension. The diluted mix should be used within 72 hours.

### 11.2 Ground Application:

Use an adequate amount of tank mix to obtain thorough coverage without excessive run off. Use the recommended per acre dosages of Foray 76B in up to the following amounts of water:

- High volume hydraulic sprayers: 100 gallons
- Mist blowers: 10 gallons

### 11.3 Aerial Application:

Foray 76B may be applied aerially, either alone or diluted with water at the dosages shown in the application rates table. Spray volumes of 6-128 ounces per acre are recommended. Best results are expected when Foray 76B is applied to dry foliage.
