Outline

1. Learning Objectives
2. Data
3. Criminogenic Needs
4. Restorative Justice Model
5. Trauma Informed Care
6. The Way Forward
Learning Objectives

1. Explain the importance of criminogenic factors.
2. Understand the FOUR most influential criminogenic factors.
3. Be able to DEFINE Trauma-Informed Care.
4. Know the SIX Key Principles of a Trauma-Informed Approach.
5. Be able to EXPLAIN the importance of the Trauma and Recovery when working with justice involved individuals.
6. Understand the importance of working collaboratively with criminal justice providers.
INDIANAPOLIS - A sheriff says county jails have become the "insane asylums" for Indiana as state inpatient care for the mentally ill has disintegrated.
Seriously Mentally Ill

- 14.5% men, 31% women in jails
- 16% of prisons
- 9% probation, 7% parole

- General Public is 5.4%
  - Adults with a serious mental illness (SMI) are defined by SAMHSA as “persons age 18 and over, who currently or at any time during the past year, have had a diagnosable mental, behavioral, or emotional disorder of sufficient duration to meet diagnostic criteria specified within the [DSM-IV], resulting in functional impairment which substantially interferes with or limits one or more major life activities” (CSAT, 1998, p. 265).
Addiction

• 53% of State and 45% of Federal prisoners
• 75% of prisoners returning to prison
• 68% of jail inmates
• General Public is 8.8%

  – According to SAMHSA, “substance use disorders occur when the recurrent use of alcohol and/or drugs causes clinically and functionally significant impairment, such as health problems, disability, and failure to meet major responsibilities at work, school, or home.”
Recidivism with Treatment

• Average Recidivism 20% reduction overall
  – 8.2% reduction in felony reconvictions for general offenders
  – 6.3% reduction for returns to prison
  – 4.7% reduction of reconvictions
Treatment Works

Figure 5.3. Changes in Criminal Activity Before vs. After Treatment

Criminogenic Risk and Needs Matter

- *Criminogenics*: The study of specific needs that must be addressed in order to habilitate criminal offenders and achieve lower recidivism rates.

- *Criminogenic Needs*: In studying recidivism, researchers have shown that there are a number of "static" factors that are predictive. These factors have been associated with recidivism and can be changed.
Criminogenic Risk and Needs Matter

- Anti-social personality
- Anti-social attitudes and values
- Anti-social associates
- Family dysfunction
- Poor self-control, poor problem-solving skills
- Substance abuse
- Lack of employment/employment skills

Andrews and Bonta, 2006
Council of State Governments Justice Center, 2013
### “Central Eight” Criminogenic Risk Factors

<table>
<thead>
<tr>
<th>Risk Factor</th>
<th>Need</th>
</tr>
</thead>
<tbody>
<tr>
<td>History of antisocial behavior</td>
<td>Build alternative behaviors</td>
</tr>
<tr>
<td>Antisocial personality pattern</td>
<td>Problem solving skills, anger management</td>
</tr>
<tr>
<td>Antisocial cognition</td>
<td>Develop less risky thinking</td>
</tr>
<tr>
<td>Antisocial associates</td>
<td>Reduce association with criminal others</td>
</tr>
<tr>
<td>Family and/or marital discord</td>
<td>Reduce conflict, build positive relationships</td>
</tr>
<tr>
<td>Poor school and/or work performance</td>
<td>Enhance performance, rewards</td>
</tr>
<tr>
<td>Few leisure or recreation activities</td>
<td>Enhance outside involvement</td>
</tr>
<tr>
<td>Substance abuse</td>
<td>Reduce use through integrated treatment</td>
</tr>
</tbody>
</table>

Council of State Governments Justice Center, 2013
The four most influential criminogenic needs are dynamic risk factors, that when addressed, can significantly affect the offender’s risk for recidivism.

1. Antisocial Cognition
2. Antisocial Personality
3. Antisocial Associates (peers)
4. Family/Marital Issues
Antisocial Cognition

Defined: Antisocial attitudes, values, beliefs and rationalization

Goal: Reduce antisocial cognition, recognize cognitive triggers, recognize risky thinking and feelings, and adopt alternative cognitions.
Antisocial Personality

Defined: Impulsive, adventurous, pleasure seeking, restlessly aggressive and irritable.

Goal: Build problem solving, self-regulation, anger awareness, and coping skills that help to maintain equanimity.
Antisocial Associates

Defined: Antisocial or criminal friends and isolation from pro-social others.

Goal: Reduce association with criminal peers, enhance contact with pro-social peers and friends.
Family/Marital Issues

Defined: Inappropriate parental monitoring and disciplining, poor family relationships.

Goal: Reduce conflict, build positive relationships, and develop/enhance healthy communication.
Criminogenic Interventions

• Targeted and timely evidence-based treatment interventions will provide the greatest long-term benefit to the community, the victim, and the offender.

• Cognitive-based behavioral interventions have been shown to be highly effective.

• Motivation to change matters.

Massaro, 2004
Center for Effective Public Policy, 2015
Criminogenic Interventions

• Hope matters. Research has shown that peers who are successfully engaging in the recovery positively influences internal narratives and motivation to change.

• Realign and actively engage pro-social supports (family members, spouses, peers, and supportive others) for offenders in their communities.

Massaro, 2004
Center for Effective Public Policy, 2015
Research has shown that certain types of interventions do not work:

- Boot camps
- Punishment-oriented programs
- Control-oriented programs
Criminogenic Risk and Behavioral Health Needs Framework

Low Criminogenic Risk (low)  Medium to High Criminogenic Risk (med/high)

Victimization can take many forms:

- Economic (having commissary items stolen)
- Coercive (being forced to perform chores)
- Manipulation (being forced to accept blame for infractions)
- Physical (being physically or sexually assaulted by another inmate)

Massaro, 2004
Experience

Each person’s experiences during incarceration will be shaped by a wide variety of factors, including:

• Severity and nature of mental illness
• Coping skills and adaptive capacity
• Supports within the facility
• Supports from the community
• Access to effective treatment

Massaro, 2004
Restorative justice is an approach to justice that focuses on the needs of the victims and the offenders, as well as the involved community. This contrasts to more punitive approaches where the main aim is to punish the offender, or satisfy abstract legal principles.
Trauma-Informed Care

• Trauma-informed care is an approach used to engage people with histories of trauma. It recognizes the presence of trauma symptoms and acknowledges the role that trauma can play in people’s lives.

• Trauma-informed criminal justice responses can help to avoid re-traumatizing individuals.
Trauma-Informed Care

• A trauma-informed approach increases safety for all, decreases the chance of an individual returning to criminal behavior, and supports the recovery of justice-involved women and men with serious mental illness.

• Partnerships across systems can also help link individuals to trauma-informed services and treatment.
DMHA recognizes that the majority of people who have behavioral health issues and are involved with the justice system have significant histories of trauma and exposure to personal and community violence.
Trauma Informed Care

• Involvement with the justice system can further trauma for these individuals and create complex trauma.

• Traumatic events can include physical and sexual abuse, neglect, bullying, community-based violence, disaster, terrorism, and war.
These experiences can:

• Challenge a person’s capacity for recovery
• Pose significant barriers to accessing services
• Result in an increased risk of interacting with the criminal justice system
Trauma Informed Care

- Fifty to ninety percent of all adults and children are exposed to a psychologically traumatic event (such as a life-threatening assault or accident, human-caused or natural disaster, or war) at some point in their lives.
Trauma Informed Care

• Recognition of the high rates of trauma and post-traumatic stress disorder among justice-involved individuals is vital.

• It is estimated that 85 percent of women in correctional settings have an early experience of physical and or sexual abuse.

National Center for PTSD, 2015
Substance Abuse Mental Health Service Administration, 2015
Other reports estimate even higher lifetime experience of traumatic events and show little difference between genders on the prevalence of trauma and abuse.

A recent study of people (both women and men) participating in jail diversion programs across the country, almost universally, reported a history of significant traumatic experience prior to incarceration (95.5% and 88.6% respectively).
Trauma Informed Care

- As many as 67% of trauma survivors experience lasting psychosocial impairment, including post-traumatic stress disorder (PTSD); panic, phobic, or generalized anxiety disorders; depression; or substance abuse.
Trauma Informed Care

Studies show that many patients who seek physical healthcare have been exposed to trauma and experience PTSD but have not received appropriate mental health care.
Trauma Informed Care

Studies show that many patients who seek physical healthcare have been exposed to trauma and experience PTSD but have not received appropriate mental health care.
A trauma-informed approach, program, organization, or system:

1. Realizes the widespread impact of trauma and understands potential paths for recovery;

2. Recognizes the signs and symptoms of trauma in clients, families, staff, and others involved with the system;

3. Responds by fully integrating knowledge about trauma into policies, procedures, and practices; and

4. Seeks to actively resist re-traumatization.
A trauma-informed approach can be implemented in any type of service setting or organization and is distinct from trauma-specific interventions or treatments that are designed specifically to address the consequences of trauma and to facilitate healing.

A trauma-informed approach is aligned with current research in psychoneuroimmunology, cognitive neuroscience, health psychology, and epigenetics.

National Center for PTSD, 2015
Substance Abuse Mental Health Service Administration, 2015
Six Key Principles of a Trauma-Informed Approach

A trauma-informed approach reflects adherence to six key principles rather than a prescribed set of practices or procedures. These principles may be generalizable across multiple types of settings, although terminology and application may be setting- or sector-specific:

1. Safety
2. Trustworthiness and Transparency
3. Peer support
4. Collaboration and mutuality
5. Empowerment, voice and choice
6. Cultural, Historical, and Gender Issues

Substance Abuse Mental Health Service Administration, 2015
Trauma-Specific Interventions

Trauma-specific intervention programs generally recognize the following:

• The survivor's need to be respected, informed, connected, and hopeful regarding their own recovery

• The interrelation between trauma and symptoms of trauma such as substance abuse, eating disorders, depression, and anxiety.

• The need to work in a collaborative way with survivors, family and friends of the survivor, and other human services agencies in a manner that will empower survivors and consumers
The Way Forward

- What does an unsuccessful program look like?
- What does a successful program look like?
The Way Forward

Evidence-based practice implies the following:

• There is a definable outcome(s).
• It is measurable.
• It is defined according to practical realities (recidivism, victim satisfaction, etc.).
The Way Forward

• Care providers should work to be have a strong knowledge of the criminal justice system.

• Clinicians should use trauma-informed and evidenced based methods to constructively enhance intrinsic motivation in offenders.

• Research indicates that motivational interviewing techniques, rather than persuasion tactics, effectively enhance motivation for initiating and maintaining behavior changes.
Ongoing Collaboration

- Build Bridge from Jail to Treatment in the Community

- Development of a coalition effort that supports holistic recovery

- Understand the unique experiences of justice involved individuals.
Ongoing Collaboration

• It is critical that treatment professionals and communities develop coalitions to reduce stigma and promote the role of resilience, resistance, and recovery in prevention, health promotion, and treatment.
Ten Fundamental Components of Recovery

1. Recovery emerges from hope
2. Recovery is person-driven
3. Recovery occurs via many pathways
4. Recovery is holistic
5. Recovery is supported by peers and allies
6. Recovery involves individual, family, and community strengths and responsibility
7. Recovery is supported through relationship and social networks
8. Recovery is culturally-based and influenced
9. Recovery is supported by addressing trauma
10. Recovery is based on respect

(Substance Abuse Mental Health Service Administration, 2013)
Recovery

In the final report of the New Freedom Commission on Mental Health:

*Recovery* refers to the process in which people are able to live, work, learn, and participate fully in their communities. For some individuals, recovery is the ability to live a fulfilling and productive life despite a disability. For others, recovery implies the reduction or complete remission of symptoms. Science has shown that having hope plays an integral role in an individual’s recovery.

Resilience

In the final report of the New Freedom Commission on Mental Health:

Resilience means the personal and community qualities that enable us to rebound from adversity, trauma, tragedy, threats, or other stresses — and to go on with life with a sense of mastery, competence, and hope. We now understand from research that resilience is fostered by a positive childhood and includes positive individual traits, such as optimism, good problem-solving skills, and treatments. Closely knit communities and neighborhoods are also resilient, providing supports for their members.
