

Indiana Department of Environmental Management

The States' View of the Air

2018

Keith Baugues
Assistant Commissioner

Indiana Department of Environmental Management
Office of Air Quality
April, 2018

EXECUTIVE SUMMARY

Air quality across the nation has improved over the past ten years or more. Unfortunately the message often found in the press, is that the air quality is terrible. This analysis demonstrates the progress made from 2000 through 2016 for ozone and fine particles (PM-2.5).

Figures 1 through 3 show the progress made for ozone, 24-hour PM-2.5 and annual PM-2.5. The bars represent the population of each period (based on the last year in the period). The portion that is green represents the number of people living in counties that measure air quality better than the standard. The portion of the bar that is red represents the number of people living in counties that measure air quality at levels above the standard. The blue portion of the bar represents the number of people that live in counties where air quality is not measured.

These assessments have been based on results of individual monitors. For example, if a county has two ozone monitors and data for one is rated as a C and the other as a D, the population of the county is split in half and half is assigned to each category; meeting the standard and not meeting the standard.

Compliance with standards is determined on a three year basis. In 2000 – 2002 approximately 110 million people lived in counties that measured ozone air quality levels better than the standard. By 2014 – 2016 this had increased to 171 million people.

The situation for fine particles (PM-2.5) is very similar. In 2000 – 2002, 184 million people lived in counties where 24-hour PM-2.5 levels were measured below the standard. By 2014 – 2016 this had increased to 198 million people.

In the 2000 – 2002 period, 137 million people lived in counties where annual PM-2.5 levels were measured below the standard. By 2014 – 2016 this had increased to 198 million people. Approximately 6.0 million people lived in counties where annual PM-2.5 levels were measured above the standard. Much of this increase is due to the implementation of the new annual PM-2.5 standard.

Even with the improvements made in air quality, there are still areas of the country that need further improvement. Table 1 shows states that have 8 hour ozone nonattainment areas based on 2014 – 2016 data. Twenty states are included.

Table 2 shows those states that violate the 24-hour PM-2.5 standard based on 2014 – 2016 data. Only five states are included.

Table 3 shows those states that violate the annual PM-2.5 standard based on 2014 – 2016 data. Only four states are included.

Table 4 summarizes for each state, the number of counties exceeding the standard, the number of counties monitored, the total number of counties, the number of people living in counties above the standard and the total population of each state.

The bottom line is that most areas of the country were meeting the PM-2.5 standard at the 2014 – 2016 review. There are still several areas of the country that violate the current ozone standard. Many areas have made considerable progress in lowering ozone levels, but further work remains to be done. During 2016, the U.S. Environmental Protection Agency (EPA) lowered the 8-hour ozone standard. This analysis compares historical air quality levels with the appropriate standard for each time period.

The States' View of the Air – 2018

This is the seventh year for this report. It was originally intended as a complimentary document to the American Lung Association's (ALA) annual report called "The State of the Air." This report starts with the same air quality data used by the ALA. For this report, it includes data for the period of 2000 – 2016.

What's New?

This report contains several revisions from previous reports. First, U.S. EPA revised the ozone standard in 2016. Previous reports had assumed that the ozone standard was constant (0.075 ppm) during the entire period. This is no longer the case. Table 5 outlines the appropriate grading scales for each year for each pollutant based upon the standard that was in place for each period.

Table 5
Grading Scales by Year
Ozone

Standard	0.085 ppm	0.075 ppm	0.070 ppm
Beginning Period	2000 - 2002	2006 -2008	2013 – 2015
Ending Period	2005 - 2007	2012 – 2014	
A	< 0.068	< 0.060	< 0.056
B	0.068 – 0.076	0.060 – 0.067	0.056 – 0.062
C	0.077 – 0.085	0.068 – 0.075	0.063 – 0.070
D	0.086 – 0.093	0.076 – 0.082	0.071 – 0.077
F	> 0.093	> 0.082	> 0.077

24-Hour PM-2.5

Standard	65 µg/m3	35 µg/m3
Beginning Period	2000 – 2002	2004 - 2006
Ending Period	2003 – 2005	
A	< 52	< 28
B	52 – 58	
C	59 – 65	32 – 35
D	66 – 71	36 – 38
F	> 71	> 38

Annual PM-2.5

Standard	15 µg/m3	12 µg/m3
Beginning Period	2000 – 2002	2011- 2013
Ending Period	2010 – 2012	
A	< 12.0	< 9.6
B	12.0 – 13.4	9.6 – 10.7
C	13.5 – 15.0	10.8 – 12.0
D	15.1 – 16.5	12.1 – 13.2
F	> 16.5	> 13.2

The review of data in this report differs from the ALA in a few significant ways. First, the design values used for both ozone and PM-2.5 are based on average values for each county. Average values are used to compare between cities or county ratings. However, when determining whether the population is exposed to air quality above or below the standard, the population is split based on values from individual monitors. This is an important distinction. While U.S. EPA's guidance for attainment/nonattainment designation purposes focuses on the worst design value for a county, this is not consistent with what people are breathing. For example, if a county has ten monitors and nine have design values below the

standard and one is slightly above the standard, U.S. EPA and ALA would assume that everyone in the county were breathing air at levels above the standard. That is obviously not correct. If you combine counties into metropolitan statistical areas (cities) consisting of several counties, the entire area would be assumed to be above the standard based on the one monitor described above. This report averages design values for all monitors in a county to determine the average level that is breathed by the residents of that county. This is not to say that some individuals could not be exposed to higher levels. However, not all residents in a county are exposed to levels associated with the highest monitor. This average design value is used only to compare between different states.

A second difference is that when design values for a number of counties are being grouped to determine the overall value for a metropolitan statistical area, the individual design values for each county are weighted by the population of that county to determine a population weighted average value. This value is more consistent with what the population is being exposed to and is in line with what health research professionals use in their analyses.

A grading system has been established for ozone and PM-2.5 in this report. Any grading system is arbitrary in nature. The key to this grading system is that any area meeting the national ambient air quality standards should not be rated lower than a “C”. In essence, we have set the standard as a “C”. Any level between 90 and 100 percent of the standard is rated a “C”. Any level between 80 and 90 percent of the standard is rated as “B”. Any level below 80 percent is set as an “A”. Any level between 101 and 110 percent of the standard is set as a “D”. Any level above 110% of the standard is rated as an “F”.

This report does not report population groups by county or state (those less than 18 or 65 and older, diabetics, etc.). It is very difficult to obtain this data for each state. Also, the methodology which apportions state totals to individual counties is questionable. It is based solely upon a comparison of age distribution of the state versus the county. In many cases other variables, may be important in making these allocations more accurately.

Information on health effects is not included in this report. Instead we provide links to U.S. EPA websites that contain this information.

Ozone: <http://epa.gov/airquality/ozonepollution/health.html>

PM-2.5: <http://epa.gov/airquality/particlepollution/health.html>

The remainder of this report contains tables that are similar to those that are in the ALA report. The ALA report focuses solely on a three year block of data and does not provide any perspective. Our report looks at three year blocks of data from 2000 through 2016 so that the reader can see how the air quality is changing over time.

Ozone

In the 2000 – 2002 period approximately 110 million people (38.3% of the U.S. population) lived in counties that met the ozone standard. During the same time period approximately 94 million people (32.7%) lived in counties where ozone was not monitored. By the 2014 – 2016 period 172 million people (53.2%) lived in counties that met the ozone standard. During the same time period over 91 million people (28.2%) lived in counties where ozone was not monitored. Figure 1 shows the distribution of people by year.

24 – Hour PM-2.5

In the 2000 – 2002 period approximately 184 million people (63.9% of the U.S. population) lived in counties that met the 24-hour PM-2.5 standard. During this same time period approximately 99 million people (34.4%) lived in counties where PM-2.5 was not monitored. By the 2014 – 2016 period over 198 million people (61.3%) lived in counties that met the 24-hour PM-2.5 standard. During the same time period

nearly 119 million people (36.8%) lived in counties where PM-2.5 was not monitored. Figure 2 shows the distribution of people by year.

Annual PM-2.5

In the 2000 – 2002 period approximately 137 million people (47.6% of the U.S. population) lived in counties that met the annual PM-2.5 standard. During the same time period approximately 99 million people (34.4%) lived in counties where PM-2.5 was not monitored. By the 2014 - 2016 period nearly 198 million people (61.3%) lived in counties that met the annual PM-2.5 standard. During the same time period nearly 119 million people (36.8%) lived in counties where PM-2.5 was not monitored. Figure 3 shows the distribution of people by year.

Note:

For the state summaries, the first table shows monitoring totals at the bottom that include county totals for areas that measure either Ozone or PM-2.5. The second set of tables includes totals monitored by pollutant.

State By State Analyses

ALABAMA

Ozone

Significant progress has been made in ozone levels in Alabama. In the 2000 – 2002 time period, approximately 1.7 million people (38.2%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to 2.8 million people (57.7%), although the standard was lowered from 0.085 ppm to 0.070 ppm. The rest of the people in 2014 – 2016 lived in counties where ozone was not measured. Figure AL-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.083 ppm. By 2014 – 2016 this had lowered to a value of 0.064 ppm, a reduction of 22.9 percent.

24-Hour PM-2.5

Significant progress has been made in 24-hour PM-2.5 levels in Alabama. In the 2000 – 2002 time period, approximately 2.4 million people (53.1%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this had increased to approximately 2.6 million people (59.2%). The remainder of the people in 2014 -2016 lived in counties where PM-2.5 was not measured. The standard was lowered from 65 µg/m3 to 35 µg/m3. Figure AL-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 34 µg/m3. By 2014 – 2016 this had lowered to a value of 18 µg/m3, a reduction of 47.1 percent.

Annual PM-2.5

Progress has been made in annual PM-2.5 levels in Alabama. In the 2000 – 2002 time period, approximately 1.5 million people (33.01%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 2.6 million people (59.2%). The remainder of the people in 2014 – 2016 lived in counties where PM-2.5 was not measured. The standard was lowered from 15 µg/m3 to 12 µg/m3. Figure AL-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 14.9 µg/m3. By 2014 – 2016 this had lowered to a value of 8.8 µg/m3, a reduction of 40.9 percent.

ALASKA

Ozone

Ozone levels in Alaska have historically been better than the standard. In the 2000 – 2002 time period, approximately two thousand people (0.3%) lived in counties that met the ozone standard and the rest of the population lived in counties where ozone was not measured. By 2014 – 2016 there were 206,923 people (27.9%) living in counties that met the ozone standard and the rest of the population lived in counties where ozone is not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure AK-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.051 ppm. By 2014 – 2016 this had lowered to a value of 0.044 ppm, a reduction of 13.7 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 450,000 people (70.0%) in Alaska lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 483,000 people (65.2%). The standard was lowered from 65 µg/m³ to 35 µg/m³. Figure AK-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 24 µg/m³. By 2014 – 2016 this had increased to a value of 27 µg/m³, an increase of 25.0 percent.

Annual PM-2.5

Annual PM-2.5 levels in Alaska have historically been better than the standard. In the 2000 – 2002 time period, approximately 450,000 people (70.0%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 483,000 (65.2%). The standard was lowered from 15 µg/m³ to 12 µg/m³. Figure AK-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 7.4 µg/m³. By 2014 – 2016 this had increased to a value of 9.0 µg/m³, an increase of 21.6 percent.

ARIZONA

Ozone

In the 2000 – 2002 time period, approximately 4.5 million people (84.3%) lived in counties that met the ozone standard. By 2014 – 2016 this had decreased to 3.8 million people (55.0%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure AZ-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.078 ppm. By 2014 – 2016 this had decreased to a value of 0.069 ppm, a reduction of 11.5 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 3.5 million people (65.7%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this had increased to approximately 6.1 million people (87.7%). The remainder of the people in 2012 – 2014 lived in counties where PM-2.5 was not measured. The standard was lowered from 65 µg/m3 to 35 µg/m3. Figure AZ-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 27 µg/m3. By 2014 – 2016 this had lowered to a value of 18 µg/m3, a reduction of 33.3 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 3.5 million people (65.7%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 6.1 million people (87.7%). The standard was lowered from 15 µg/m3 to 12 µg/m3. Figure AZ-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 10.9 µg/m3. By 2014 – 2016 this had lowered to a value of 7.4 µg/m3, a reduction of 32.1 percent.

ARKANSAS

Ozone

Progress has been made in ozone levels in Arkansas. In the 2000 – 2002 time period, approximately 200,000 people (7.4%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 721,000 people (24.1%) although the standard was lowered from 0.085 ppm to 0.070 ppm. Figure AR-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.085 ppm. By 2014 – 2016 this had lowered to a value of 0.063 ppm, a reduction of 25.9 percent.

24-Hour PM-2.5

24-hour PM-2.5 levels in Arkansas have historically been better than the standard. In the 2000 – 2002 time period, approximately 1 million people (38.2%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 – 2016 this had decreased to approximately 0.9 million people (29.6%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 µg/m³ to 35 µg/m³. Figure AR-2 shows the distribution of people by year. The population weighted 24-hour design value in 2000 – 2002 was 30 µg/m³. By 2014 - 2016 this had lowered to a value of 20 µg/m³, a reduction of 33.3 percent.

Annual PM-2.5

Annual PM-2.5 levels in Arkansas have historically been better than the standard. In the 2000 – 2002 time period, approximately 1 million people (38.2%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had decreased to approximately 0.9 million people (29.6%). The remainder of the population lived in areas where PM-2.5 was not measured. The standard was lowered from 15 µg/m³ to 12 µg/m³. Figure AR-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 13.2 µg/m³. By 2014 – 2016 this had lowered to a value of 9.2 µg/m³, a reduction of 30.3 percent.

CALIFORNIA

Ozone

In the 2000 – 2002 time period, approximately 21.4 million people (61.6%) lived in counties that met the ozone standard. By 2014 – 2016 this had decreased to approximately 18.3 million people (46.7%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure CA-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.079 ppm. By 2014 – 2016 this had lowered to a value of 0.074 ppm, a reduction of 6.3 percent.

24-Hour PM-2.5

Significant progress has been made in 24-hour PM-2.5 levels in California. In the 2000 – 2002 time period, approximately 27 million people (77.4%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this had increased to approximately 34.0 million people (86.6%). The standard was lowered from 65 µg/m³ to 35 µg/m³. Figure CA-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 51 µg/m³. By 2014 – 2016 this had lowered to a value of 26 µg/m³, a reduction of 49.0 percent.

Annual PM-2.5

Significant progress has been made in annual PM-2.5 levels in California. In the 2000 – 2002 time period, approximately 12.8 million people (36.7%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 33.0 million people (84.2%). The standard was lowered from 15 µg/m³ to 12 µg/m³. Figure CA-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 17.1 µg/m³. By 2014 – 2016 this had lowered to a value of 9.4 µg/m³, a reduction of 45.0 percent.

COLORADO

Ozone

In the 2000 – 2002 time period, approximately 3.3 million people (74.2%) lived in counties that met the ozone standard. By 2014 – 2016 this had decreased to approximately 3.5 million people (63.1%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure CO-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.072 ppm. By 2014 – 2016 this had lowered to a value of 0.069 ppm, a reduction of 4.2 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 2.7 million people (60.9%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this had increased to approximately 3.7 million people (66.4%). The remainder of the population lived in areas where PM-2.5 is not measured. The standard was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure CO-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 23 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 19 $\mu\text{g}/\text{m}^3$, a reduction of 17.4 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 2.7 million people (60.9%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 3.7 million people (66.4%). The remainder of the population lived in areas where PM-2.5 is not measured. The standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12 $\mu\text{g}/\text{m}^3$. Figure CO-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 8.7 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 6.2 $\mu\text{g}/\text{m}^3$, a reduction of 28.7 percent.

CONNECTICUT

Ozone

In the 2000 – 2002 time period, no people lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 116,000 people (3.2%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure CT-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.094 ppm. By 2014 – 2016 this had lowered to a value of 0.076 ppm, a reduction of 19.1 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 2.9 million people (82.6%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 3.1 million people (88.0%). In 2014 - 2016 the remainder of the population lived in areas where PM-2.5 is not measured. The standard was lowered from 65 µg/m³ to 35 µg/m³. Figure CT-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 34 µg/m³. By 2014 – 2016 this had lowered to a value of 19 µg/m³, a reduction of 44.1 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 2.7 million people (76.7%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 3.1 million people (88.0%). The remainder of the population lived in areas where PM-2.5 is not measured. The standard was lowered from 15 µg/m³ to 12 µg/m³. Figure CT-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 12.8 µg/m³. By 2014 – 2016 this had lowered to a value of 7.6 µg/m³, a reduction of 40.6 percent.

DELAWARE

Ozone

In the 2000 – 2002 time period, no people lived in counties that met the ozone standard. By 2014 – 2016 approximately 0.95 million people (100.0%) lived in counties that met the ozone standard. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure DE-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.093 ppm. By 2014 – 2016 this had lowered to a value of 0.068 ppm, a reduction of 26.9 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 0.81 million people (100.0%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 all people in Delaware lived in counties that met the 24-hour PM-2.5 standard. The standard was lowered from 65 µg/m³ to 35 µg/m³. Figure DE-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 38 µg/m³. By 2014 – 2016 this had lowered to a value of 21 µg/m³, a reduction of 44.7 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 0.55 million people (68.4%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 all people in Delaware lived in counties that met the annual PM-2.5 standard. The standard was lowered from 15 µg/m³ to 12 µg/m³. Figure DE-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 14.5 µg/m³. By 2014 – 2016 this had lowered to a value of 8.6 µg/m³, a reduction of 40.7 percent.

FLORIDA

Ozone

In the 2000 – 2002 time period, approximately 13.7 million people (82.2%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to 16.3 million people (79.0%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure FL-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.072 ppm. By 2014 – 2016 this had lowered to a value of 0.061 ppm, a reduction of 15.3 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 12.4 million people (74.3%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 11.5 million people (55.9%). The standard was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure FL-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 23 $\mu\text{g}/\text{m}^3$. By 2014 -2016 this had lowered to a value of 15 $\mu\text{g}/\text{m}^3$, a reduction of 34.8 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 12.4 million people (74.3%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had decreased to approximately 11.5 million people (55.9%). The standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12 $\mu\text{g}/\text{m}^3$. Figure FL-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 9.9 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 6.5 $\mu\text{g}/\text{m}^3$, a reduction of 34.3 percent.

GEORGIA

Ozone

In the 2000 – 2002 time period, approximately 0.7 million people (8.2%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to 1.8 million people (17.2%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure GA-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.092 ppm. By 2014 – 2016 this had lowered to a value of 0.069 ppm, a reduction of 25.0 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 3.9 million people (45.4%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 5.7 million people (54.8%). The standard was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure GA-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 38 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 19 $\mu\text{g}/\text{m}^3$, a reduction of 50.0 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 0.6 million people (7.1%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 5.7 million people (54.8%). The standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12 $\mu\text{g}/\text{m}^3$. Figure GA-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 16.6 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 9.3 $\mu\text{g}/\text{m}^3$, a reduction of 44.0 percent.

HAWAII

Ozone

Ozone levels in Hawaii have historically been better than the standard. In the 2000 – 2002 time period, approximately 1.0 million people (84.3%) lived in counties that met the ozone standard. By 2013 – 2015 this was a little under 1.0 million people (69.8%). All people in both years either lived in counties with air quality rated as A or lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure HI-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.043 ppm. By 2013 – 2015 this had increased to a value of 0.051 ppm, an increase of 18.6 percent.

24-Hour PM-2.5

24-hour PM-2.5 levels in Hawaii have historically been better than the standard. In the 2000 – 2002 time period, approximately 1.0 million people (82.7%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2013 - 2015 this was approximately 1.4 million people (99.9%). All people in both years either lived in counties with air quality rated as A or lived in counties where PM-2.5 was not measured. The standard was lowered from 65 µg/m³ to 35 µg/m³. Figure HI-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 10 µg/m³. By 2013 – 2015 this had increased to a value of 11 µg/m³, a 10.0 percent increase.

Annual PM-2.5

Annual PM-2.5 levels in Hawaii have historically been better than the standard. In the 2000 – 2002 time period, approximately 1.0 million people (82.7%) lived in counties where annual PM-2.5 levels met the standard. By 2013 – 2015 this had increased to approximately 1.4 million people (99.9%). All people in both years either lived in counties with air quality rated as A or lived in counties where PM-2.5 was not measured. The standard was lowered from 15 µg/m³ to 12 µg/m³. Figure HI-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 4.5 µg/m³. By 2013 – 2015 this had increased to a value of 5.2 µg/m³, an increase of 15.6 percent.

IDAHO

Ozone

In the 2000 – 2002 time period, no people lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 450,000 people (26.5%) and the rest of the population lived in areas where ozone is not monitored. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure ID-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.071 ppm. By 2014 – 2016 this had lowered to a value of 0.065 ppm, a reduction of 8.5 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 0.7 million people (50.3%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 93,000 people (5.6%). The standard was lowered from 65 µg/m³ to 35 µg/m³. Figure ID-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 29 µg/m³. By 2014 – 2016 this had lowered to a value of 20 µg/m³, a reduction of 31.0 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 675,000 people (50.3%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 93,000 people (5.6%). The standard was lowered from 15 µg/m³ to 12 µg/m³. Figure ID-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 8.2 µg/m³. By 2014 - 2016 this was 7.0 µg/m³, a reduction of 14.7 percent.

ILLINOIS

Ozone

In the 2000 – 2002 time period, approximately 9.2 million people (73.2%) lived in counties that met the ozone standard. By 2014 – 2016 this had decreased to 8.6 million people (66.9%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure IL-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.077 ppm. By 2014 – 2016 this had lowered to a value of 0.069, a reduction of 10.4 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 10.2 million people (81.2%) lived in counties where 24-hour PM-2.5 levels met the standard. Data for 2012 and 2013 have been removed. By 2014 -2016 this had lowered to a value of 7.7 million people (60.0%). The standard was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure IL-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 -2002 was 36 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 21 $\mu\text{g}/\text{m}^3$, a reduction of 41.7 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 3.5 million people (27.6%) lived in counties where annual PM-2.5 levels met the standard. Data for 2012 and 2013 have been removed. By 2014 – 2016 this had increased to 7.7 million people (60.0%). The standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12 $\mu\text{g}/\text{m}^3$. Figure IL-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 15.5 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to 9.5 $\mu\text{g}/\text{m}^3$, a reduction of 38.7 percent.

INDIANA

Ozone

Significant progress has been made in ozone levels in Indiana. In the 2000 – 2002 time period, no people lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 4.5 million people (67.4%). Figure IN-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.086 ppm. By 2014 – 2016 this had lowered to a value of 0.064, a reduction of 25.6 percent.

24-Hour PM-2.5

Significant progress has been made in 24-hour PM-2.5 levels in Indiana. In the 2000 – 2002 time period, approximately 2.1 million people (33.5%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 4.2 million people (63.4%) and the rest of the population lived in areas where PM-2.5 was not measured. Figure IN-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 -2002 was 36 µg/m³. By 2014 – 2016 this had lowered to a value of 24m µg/m³, a reduction of 33.3 percent.

Annual PM-2.5

Significant progress has been made in annual PM-2.5 levels in Indiana. In the 2000 – 2002 time period, approximately 1.4 million people (23.1%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 4.2 million people (63.4%). Figure IN-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 15.5 µg/m³. By 2014 – 2016 this had lowered to 9.8 µg/m³, a reduction of 36.8 percent.

IOWA

Ozone

In the 2000 – 2002 time period, approximately 0.7 million people (25.4%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 1.1 million people (36.0%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure IA-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.069 ppm. By 2014 – 2016 this had lowered to a value of 0.060 ppm, a reduction of 13.0 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 1.4 million people (46.5%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 1.5 million people (48.3%). The remainder of the population lived in counties where PM-2.5 was not measured. The standards was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure IA-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 28 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 21 $\mu\text{g}/\text{m}^3$, a reduction of 25.0 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 1.4 million people (46.5%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had decreased to approximately 1.5 million people (48.3%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12 $\mu\text{g}/\text{m}^3$. Figure IA-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 10.9 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 8.2 $\mu\text{g}/\text{m}^3$, a reduction of 24.7 percent.

Ozone

In the 2000 – 2002 time period, approximately 657 thousand people (24.2%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 1.6 million people (53.7%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure KS-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.077 ppm. By 2014 – 2016 this had lowered to a value of 0.062 ppm, a reduction of 19.5 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 1.3 million people (48.1%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 1.5 million people (50.8%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 µg/m³ to 35 µg/m³. Figure KS-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 26 µg/m³. By 2014 – 2016 this had lowered to a value of 20 µg/m³, a reduction of 23.1 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 1.3 million people (48.1%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 1.5 million people (50.8%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 µg/m³ to 12 µg/m³. Figure KS-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 11.5 µg/m³. By 2014 – 2016 this had lowered to a value of 7.6 µg/m³, a reduction of 33.9 percent.

KENTUCKY

Ozone

In the 2000 – 2002 time period, approximately 1.9 million people (45.4%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 2.1 million people (48.3%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure KY-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.082 ppm. By 2014 – 2016 this had lowered to a value of 0.066 ppm, a reduction of 19.5 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 1.8 million people (45.1%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 2.0 million people (45.9%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure KY-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 36 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 20 $\mu\text{g}/\text{m}^3$, a reduction of 44.4 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 1.4 million people (33.7%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 2.0 million people (45.9%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12 $\mu\text{g}/\text{m}^3$. Figure KY-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 15.6 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 9.1 $\mu\text{g}/\text{m}^3$, a reduction of 41.7 percent.

LOUISIANA

Ozone

In the 2000 – 2002 time period, approximately 2.8 million people (61.2%) lived in counties that met the ozone standard. By 2014 – 2016 this had decreased to approximately 2.3 million people (49.5%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure LA-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.080 ppm. By 2014 – 2016 this had lowered to a value of 0.066 ppm, a reduction of 17.5 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 2.6 million people (57.5%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 2.2 million people (46.7%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure LA-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 29 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 24 $\mu\text{g}/\text{m}^3$, a reduction of 17.2 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 2.6 million people (57.5%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 2.2 million people (46.7%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12 $\mu\text{g}/\text{m}^3$. Figure LA-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 12.2 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 9.8 $\mu\text{g}/\text{m}^3$, a reduction of 19.7 percent.

MAINE

Ozone

In the 2000 – 2002 time period, approximately 240 thousand people (18.6%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 1.1 million people (84.5%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure ME-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.083 ppm. By 2014 – 2016 this had lowered to a value of 0.061 ppm, a reduction of 26.5 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 1.0 million people (74.4%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 0.62 million people (46.5%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure ME-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 28 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 17 $\mu\text{g}/\text{m}^3$, a reduction of 39.3 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 1.0 million people (74.4%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had decreased to approximately 0.62 million people (46.5%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12 $\mu\text{g}/\text{m}^3$. Figure ME-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 10.1 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 6.9 $\mu\text{g}/\text{m}^3$, a reduction of 31.7 percent.

MARYLAND

Ozone

In the 2000 – 2002 time period, no people lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 5.2 million people (86.7%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure MD-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.094 ppm. By 2014 – 2016 this had lowered to a value of 0.068 ppm, a reduction of 27.7 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 4.1 million people (75.2%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 4.6 million people (75.6%). The standard was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure MD-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 37 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 21 $\mu\text{g}/\text{m}^3$, a reduction of 43.2 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 2.1 million people (39.1%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 4.6 million people (75.6%). The standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12 $\mu\text{g}/\text{m}^3$. Figure MD-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 15.1 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 8.7 $\mu\text{g}/\text{m}^3$, a reduction of 42.4 percent.

MASSACHUSETTS

Ozone

In the 2000 – 2002 time period, approximately 1 million people (16.1%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 6.4 million people (94.6%). The remainder of the population lived in counties where ozone was no monitored. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure MA-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.086 ppm. By 2014 – 2016 this had lowered to a value of 0.064 ppm, a reduction of 25.6 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 6.1 million people (95.0%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 4.1 million people (60.5%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 µg/m³ to 35 µg/m³. Figure MA-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 29 µg/m³. By 2014 – 2016 this had lowered to a value of 16 µg/m³, a reduction of 44.8 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 6.1 million people (95.0%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 4.1 million people (60.5%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 µg/m³ to 12 µg/m³. Figure MA-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 11.3 µg/m³. By 2014 – 2016 this had lowered to a value of 6.3 µg/m³, a reduction of 44.2 percent.

MICHIGAN

Ozone

In the 2000 – 2002 time period, 5.9 million people (59.2%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 5.3 million people (53.1%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure MI-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.084 ppm. By 2014 – 2016 this had lowered to a value of 0.069 ppm, a reduction of 17.9 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 5.9 million people (59.2%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 6.7 million people (67.3%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure MI-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 37 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 24 $\mu\text{g}/\text{m}^3$, a reduction of 35.1 percent

Annual PM-2.5

In the 2000 – 2002 time period, approximately 3.8 million people (38.4%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 6.7 million people (67.3%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12 $\mu\text{g}/\text{m}^3$. Figure MI-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 14.6 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 8.9 $\mu\text{g}/\text{m}^3$, a reduction of 39.0 percent.

MINNESOTA

Ozone

In the 2000 – 2002 time period, approximately 1.1 million people (21.9%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 2.9 million people (51.8%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure MN-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.068 ppm. By 2014 – 2016 this had lowered to a value of 0.058 $\mu\text{g}/\text{m}^3$, a reduction of 14.7 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 2.4 million people (46.9%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 3.8 million people (68.0%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure MN-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 29 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 18 $\mu\text{g}/\text{m}^3$, a reduction of 37.9 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 2.4 million people (46.9%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 3.8 million people (68.0%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12 $\mu\text{g}/\text{m}^3$. Figure MN-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 -2002 was 10.8 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 7.0 $\mu\text{g}/\text{m}^3$, a reduction of 35.2 percent.

MISSISSIPPI

Ozone

In the 2000 – 2002 time period, approximately 1.0 million people (34.0%) lived in counties that met the ozone standard. By 2013 – 2015 this was approximately 1.0 million people (33.9%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure MS-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.080 ppm. By 2013 – 2015 this had lowered to a value of 0.064 ppm, a reduction of 20.0 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 1.4 million people (47.6%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2013 - 2015 this was approximately 0.9 million people (30.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 µg/m³ to 35 µg/m³. Figure MS-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 30 µg/m³. By 2013 – 2015 this had lowered to a value of 20 µg/m³, a reduction of 33.3 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 1.4 million people (47.6%) lived in counties where annual PM-2.5 levels met the standard. By 2013 – 2015 this had decreased to approximately 0.9 million people (30.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 µg/m³ to 12 µg/m³. Figure MS-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 13.0 µg/m³. By 2013 – 2015 this had lowered to a value of 9.4 µg/m³, a reduction of 27.7percent.

MISSOURI

Ozone

In the 2000 – 2002 time period, approximately 1.2 million people (21.5%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 2.2 million people (36.3%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure MO-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.084 ppm. By 2014 – 2016 this had lowered to a value of 0.066 ppm, a reduction of 21.4 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 3.1 million people (54.1%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 2.7 million people (43.8%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure MO-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 32 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 21 $\mu\text{g}/\text{m}^3$, a reduction of 34.4 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 2.8 million people (50.2%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 2.7 million people (43.8%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 $\mu\text{g}/\text{m}^3$ to 12 $\mu\text{g}/\text{m}^3$. Figure MO-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 13.6 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 9.1 $\mu\text{g}/\text{m}^3$, a reduction of 33.1 percent.

MONTANA

Ozone

In the 2000 – 2002 time period, approximately 78 thousand people (8.5%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 318 thousand people (30.5%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure MT-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.052 ppm. By 2014 – 2016 this had increased to 0.054 ppm, an increase of 3.8 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 0.54 million people (59.2%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 0.37 million people (35.1%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 µg/m³ to 35 µg/m³. Figure MT-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 - 2002 was 27 µg/m³. By 2014 – 2016 this had lowered to a value of 22 µg/m³, a reduction of 18.5 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 0.52 million people (57.1.6%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 0.37 million people (35.1%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 µg/m³ to 12 µg/m³. Figure MT-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 8.4 µg/m³. By 2014 – 2016 this had lowered to a value of 6.9 µg/m³, a reduction of 17.9 percent.

NEBRASKA

Ozone

In the 2000 – 2002 time period, approximately 0.7 million people (42.3%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 0.9 million people (45.8%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure NE-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.059 ppm. By 2014 – 2016 this value was 0.060 ppm an increase of 1.7 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 0.9 million people (49.7%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 1.1 million people (59.0%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 µg/m3. Figure NE-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 -2002 was 25 µg/m3. By 2014 – 2016 this had lowered to a value of 17 µg/m3, a reduction of 32.0 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 0.9 million people (49.7%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 1.1 million people (59.0%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 µg/m3. Figure NE-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 10.3 µg/m3. By 2014 – 2016 this had lowered to a value of 7.4 µg/m3, a reduction of 28.2 percent.

Ozone

In the 2000 – 2002 time period, approximately 1.2 million people (56.6%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 2.2 million people (75.2%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure NV-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.074 ppm. By 2014 – 2016 this had lowered to a value of 0.069 ppm, a reduction of 6.8 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 1.9 million people (86.7%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 2.7 million people (92.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 34 µg/m³. Figure NV-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 21 µg/m³. By 2014 -2016 this had decreased to 19 µg/m³, a decrease of 9.5 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 1.9 million people (86.7%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 2.7 million people (92.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 µg/m³. Figure NV-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 8.1 µg/m³. By 2014 – 2016 this had decreased to a value of 6.4 µg/m³, a decrease of 21.0 percent.

NEW HAMPSHIRE

Ozone

In the 2000 – 2002 time period, approximately 1.2 million people (92.8%) lived in counties that met the ozone standard. By 2013 – 2015 this was approximately 0.97 million people (72.6%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure NH-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.079 ppm. By 2013 – 2015 this had lowered to a value of 0.064 ppm, a reduction of 19.0 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 33 thousand people (2.6%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2013 - 2015 this was approximately 0.9 million people (70.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 µg/m3. Figure NH-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 -2002 was 27 µg/m3. By 2013 – 2015 this had lowered to 16 µg/m3, a reduction of 40.7 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 33 thousand people (2.6%) lived in counties where annual PM-2.5 levels met the standard. By 2013 – 2015 this had increased to approximately 0.9 million people (70.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 µg/m3. Figure NH-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 9.7 µg/m3. By 2013 -2015 this had lowered to a value of 6.5 µg/m3, a reduction of 33.0 percent.

NEW JERSEY

Ozone

In the 2000 – 2002 time period, no people lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 3.3 million people (37.3%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure NJ-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.098 ppm. By 2014 – 2016 this had lowered to a value of 0.070 ppm, a reduction of 28.6 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 4.8 million people (56.5%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 7.0 million people (77.8%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 $\mu\text{g}/\text{m}^3$. Figure NJ-2 shows the distribution of people by year. The 24-hour population weighted PM-2.5 design value in 2000 – 2002 was 35 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 21 $\mu\text{g}/\text{m}^3$, a reduction of 40.0 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 4.0 million people (46.2%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 7.0 million people (77.8%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 $\mu\text{g}/\text{m}^3$. Figure NJ-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 14.1 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 8.4 $\mu\text{g}/\text{m}^3$, a reduction of 40.4 percent.

NEW MEXICO

Ozone

In the 2000 – 2002 time period, 1.1 million people (58.8%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 1.5 million people (74.0%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure NM-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.072 ppm. By 2014 -2016 this had lowered to a value of 0.065 ppm, a reduction of 9.7 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 1.1 million people (60.3%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 1.0 million people (46.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 µg/m3. Figure NM-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 19 µg/m3. By 2014 -2016 this had lowered to a value of 16, a reduction of 15.8 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 1.1 million people (60.3%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 1.0 million people (46.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 µg/m3. Figure NM-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 7.1 µg/m3. By 2014 – 2016 this had increased to a value of 7.7 µg/m3, an increase of 8.5 percent.

NEW YORK

Ozone

In the 2000 – 2002 time period, 6.5 million people (34.2%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 10.4 million people (52.7%). The ozone standard was lowered from .085 ppm to 0.070 ppm. Figure NY-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.085 ppm. By 2014 – 2016 this had lowered to a value of 0.068 ppm, a reduction of 20.0 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 13.7 million people (71.8%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 13.1 million people (66.4%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 $\mu\text{g}/\text{m}^3$. Figure NY-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 35 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 19 $\mu\text{g}/\text{m}^3$, a reduction of 45.7 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 12.3 million people (64.0%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 13.1 million people (66.4%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 $\mu\text{g}/\text{m}^3$. Figure NY-3 shows the distribution of people by year. The population weighted annual PM-2.5 in 2000 – 2002 was 13.3 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 7.8 $\mu\text{g}/\text{m}^3$, a reduction of 41.4 percent.

People Breathing Various Air Quality Levels - Annual PM-2.5 New York

NORTH CAROLINA

Ozone

In the 2000 – 2002 time period, 1.1 million people (12.9%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 5.7 million people (56.2%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure NC-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.090 ppm. By 2014 – 2016 this had lowered to a value of 0.065 ppm, a reduction of 27.8 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 4.3 million people (51.8%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 4.4 million people (43.8%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 $\mu\text{g}/\text{m}^3$. Figure NC-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 31 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 17 $\mu\text{g}/\text{m}^3$, a reduction of 45.2 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 3.4 million people (41.4%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 4.4 million people (43.8%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 $\mu\text{g}/\text{m}^3$. Figure NC-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 14.4 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 8.3 $\mu\text{g}/\text{m}^3$, a reduction of 42.4 percent.

NORTH DAKOTA

Ozone

In the 2000 – 2002 time period, 0.14 million people (21.4%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 0.33 million people (43.7%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 to 0.070 ppm. Figure ND-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.062 ppm. By 2014 – 2016 this had lowered to a value of 0.056 ppm, a reduction of 9.7 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 0.21 million people (32.7%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 0.33 million people (44.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 µg/m³. Figure ND-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 in 2000 – 2002 was 21 µg/m³. By 2014 – 2016 this had lowered to a value of 17 µg/m³, a reduction of 19.0 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 0.21 million people (32.7%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 0.33 million people (44.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 µg/m³. Figure ND-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 7.3 µg/m³. By 2014 – 2016 this had lowered to a value of 5.2 µg/m³, a reduction of 28.8 percent.

OHIO

Ozone

In the 2000 – 2002 time period, 4.5 million people (39.5%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 7.0 million people (60.4%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure OH-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.087 ppm. By 2014 – 2016 this had lowered to a value of 0.067 ppm, a reduction of 23.0 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, 6.2 million people (54.4%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 6.9 million people (59.1%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 $\mu\text{g}/\text{m}^3$. Figure OH-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 40 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 21 $\mu\text{g}/\text{m}^3$, a reduction of 47.5 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 1.1 million people (9.7%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 6.9 million people (59.1%). The standard was lowered from 15 to 12 $\mu\text{g}/\text{m}^3$. Figure OH-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 16.4 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 9.6 $\mu\text{g}/\text{m}^3$, a reduction of 41.5 percent.

OKLAHOMA

Ozone

In the 2000 – 2002 time period, 1.4 million people (40.3%) lived in counties that met the ozone standard. By 2013 – 2015 this had increased to approximately 2.4 million people (60.5). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure OK-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.081 ppm. By 2013 – 2015 this had lowered to a value of 0.067 ppm, a reduction of 17.3 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 1.5 million people (52.9%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2013 - 2015 this was approximately 1.5 million people (38.4%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 µg/m³ to 35 µg/m³. Figure OK-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 27 µg/m³. By 2013 – 2015 this had lowered to a value of 20 µg/m³, a reduction of 25.9 percent

Annual PM-2.5

In the 2000 – 2002 time period, approximately 1.8 million people (52.9%) lived in counties where annual PM-2.5 levels met the standard. By 2013 – 2015 this had decreased to approximately 1.5 million people (38.4%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 µg/m³. Figure OK-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 11.1 µg/m³. By 2013 – 2015 this had lowered to a value of 8.6 µg/m³, a reduction of 22.5m percent.

OREGON

Ozone

In the 2000 – 2002 time period, approximately 1.2 million (34.2%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 2.8 million people (69.4%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure OR-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.062 ppm. By 2014 – 2016 this had lowered to a value of 0.059 ppm, a reduction of 4.8 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 2.6 million people (73.6%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 2.1 million people (52.2%). The standard was lowered from 65 to 35 µg/m³. Figure OR-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 29 µg/m³. By 2014 – 2016 this had decreased to a value of 23 µg/m³, an increase of 20.7 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 2.6 million people (73.6%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had decreased to approximately 2.2 million people (52.7%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 µg/m³. Figure OR-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 8.7 µg/m³. By 2014 -2016 this had lowered to a value of 7.1 µg/m³, a reduction of 18.4 percent.

Ozone

In the 2000 – 2002 time period, approximately 1.7 million people (12.4%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 8.7 million people (67.7%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure PA-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.091 ppm. By 2014 – 2016 this had lowered to a value of 0.068 ppm, a reduction of 25.3 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 8.9 million people (72.1%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014- 2016 this was approximately 8.0 million people (62.5%). The standard was lowered from 65 $\mu\text{g}/\text{m}^3$ to 35 $\mu\text{g}/\text{m}^3$. Figure PA-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 39 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 25 $\mu\text{g}/\text{m}^3$, a reduction of 35.9 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 4.4 million people (35.8%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 7.8 million people (60.9%). The standard was lowered from 15 to 12 $\mu\text{g}/\text{m}^3$. Figure PA-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 15.1 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 10.2 $\mu\text{g}/\text{m}^3$, a reduction of 32.5 percent.

RHODE ISLAND

Ozone

In the 2000 – 2002 time period, no people lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 0.9 million people (87.6%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure RI-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.092 ppm. By 2014 – 2016 this had lowered to a value of 0.069 ppm, a reduction of 25.0 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 0.9 million people (87.1%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 0.9 million people (87.5%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 µg/m³. Figure RI-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 28 µg/m³. By 2014 – 2016 this had lowered to a value of 17 µg/m³, a reduction of 39.3 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 0.9 million people (87.1%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 0.9 million people (87.5%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 µg/m³. Figure RI-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 10.2 µg/m³. By 2014 – 2016 this had lowered to a value of 6.4 µg/m³, a reduction of 37.3 percent.

SOUTH CAROLINA

Ozone

In the 2000 – 2002 time period, 1.3 million people (30.9%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 2.8 million people (57.3%). The remainder of the population lived in counties where ozone was not monitored. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure SC-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.082 ppm. By 2014 – 2016 this had lowered to a value of 0.061 ppm, a reduction of 25.6 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 2.0 million people (49.6%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 2.2 million people (43.9%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 $\mu\text{g}/\text{m}^3$. Figure SC-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 29 $\mu\text{g}/\text{m}^3$. By 2014 -2016 this had lowered to a value of 17 $\mu\text{g}/\text{m}^3$, a reduction of 41.4 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 2.0 million people (49.6%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 2.2 million people (43.9%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 $\mu\text{g}/\text{m}^3$. Figure SC-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 13.6 $\mu\text{g}/\text{m}^3$. By 2014 -2016 this had lowered to a value of 8.3 $\mu\text{g}/\text{m}^3$, a reduction of 39.0 percent.

SOUTH DAKOTA

Ozone

In the 2000 – 2002 time period, there were no ozone monitors and no people lived in counties where measured air quality met the ozone standard. By 2014 – 2016 this had increased to approximately 0.28 million people (31.9%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure SD-1 shows the distribution of people by year. The population weighted ozone design value in 2002 – 2004 was 0.068 ppm. By 2014 – 2016 this had lowered to a value of 0.062 ppm, a reduction of 8.8 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 0.3 million people (40.8%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 0.42 million people (49.1%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 $\mu\text{g}/\text{m}^3$. Figure SD-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 23 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 18 $\mu\text{g}/\text{m}^3$, a reduction of 21.7 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 0.3 million people (40.8%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 0.42 million people (49.1%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 $\mu\text{g}/\text{m}^3$. Figure SD-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 8.9 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 6.7 $\mu\text{g}/\text{m}^3$, a reduction of 24.7 percent.

TENNESSEE

Ozone

In the 2000 – 2002 time period, 0.96 million people (16.5%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 3.6 million people (53.8%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure TN-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.087 ppm. By 2014 – 2016 this had lowered to a value of 0.065 ppm, a reduction of 25.3 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 3.0 million people (52.0%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 3.6 million people (54.1%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 $\mu\text{g}/\text{m}^3$. Figure TN-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 35 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 18 $\mu\text{g}/\text{m}^3$, a reduction of 48.6 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 1.8 million people (30.4%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 3.6 million people (54.1%). The standard was lowered from 15 to 12 $\mu\text{g}/\text{m}^3$. Figure TN-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 15.1 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 8.6, a reduction of 43.0 percent.

TEXAS

Ozone

In the 2000 – 2002 time period, 5.9 million people (27.0%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 11.4 million people (40.9%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure TX-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.088 ppm. By 2014 – 2016 this had lowered to a value of 0.068 ppm, a reduction of 22.7 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 14.1 million people (65.2%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 13.7 million people (49.3%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 $\mu\text{g}/\text{m}^3$. Figure TX-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 28 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 20 $\mu\text{g}/\text{m}^3$, a reduction of 28.6 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 14.1 million people (65.2%) lived in counties where annual PM-2.5 levels met the standard. By 2014– 2016 this had decreased to approximately 13.7 million people (49.3%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 $\mu\text{g}/\text{m}^3$. Figure TX-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 11.2 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 9.4 $\mu\text{g}/\text{m}^3$, a reduction of 16.1 percent.

Ozone

In the 2000 – 2002 time period, 1.9 million people (80.7%) lived in counties that met the ozone standard. By 2014 – 2016 this had decreased to approximately 0.29 million people (9.4%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure UT-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.077 ppm. By 2014 – 2016 this had lowered to a value of 0.072 ppm, a reduction of 6.5 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 1.8 million people (78.0%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 1.0 million people (32.8%). The standard was lowered from 65 to 35 µg/m3. Figure UT-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 50 µg/m3. By 2014 – 2016 this had lowered to a value of 34 µg/m3, a reduction of 32.0 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 1.8 million people (78.0%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 2.1 million people (69.5%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 µg/m3. Figure UT-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 11.5 µg/m3. By 2014 – 2016 this had lowered to a value of 7.9 µg/m3, a reduction of 31.3 percent.

VERMONT

Ozone

In the 2000 – 2002 time period, 0.19 million people (30.3%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 0.2 million people (31.7%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure VT-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.078 ppm. By 2014 – 2016 this had lowered to a value of 0.061 ppm, a reduction of 21.8 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 0.31 million people (50.1%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 0.22 million people (35.4%). The standard was lowered from 65 to 35 µg/m3. Figure VT-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 29 µg/m3. By 2014 – 2016 this had lowered to a value of 16 µg/m3, a reduction of 44.8 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 0.31 million people (50.1%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 0.22 million people (35.4%). The standard was lowered from 15 to 12 µg/m3. Figure VT-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 9.7 µg/m3. By 2014 – 2016 this had lowered to a value of 6.0 µg/m3, a reduction of 38.1 percent.

VIRGINIA

Ozone

In the 2000 – 2002 time period, 0.57 million people (7.8%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 3.3 million people (38.7%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure VA-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.089 ppm. By 2014 – 2016 this had lowered to a value of 0.066 ppm, a reduction of 25.8 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 3.1 million people (42.9%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 4.0 million people (47.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 $\mu\text{g}/\text{m}^3$. Figure VA-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 33 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 18 $\mu\text{g}/\text{m}^3$, a reduction of 45.5 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 3.1 million people (42.3%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 4.0 million people (47.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 $\mu\text{g}/\text{m}^3$. Figure VA-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 13.6 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 7.8 $\mu\text{g}/\text{m}^3$, a reduction of 42.6 percent.

WASHINGTON

Ozone

In the 2000 – 2002 time period, approximately 3.9 million people (63.8%) lived in counties that met the ozone standard. In 2014 – 2016 this value was 4.7 million people (64.0%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure WA-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.058 ppm. By 2014 – 2016 this had lowered to a value of 0.057 ppm, a reduction of 1.7 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 4.7 million people (77.5%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 4.5 million people (62.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 $\mu\text{g}/\text{m}^3$. Figure WA-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 in 2000 - 2002 was 32 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 21 $\mu\text{g}/\text{m}^3$, a reduction of 34.4 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 4.7 million people (77.5%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this was approximately 4.5 million people (62.2%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 $\mu\text{g}/\text{m}^3$. Figure WA-3 shows the distribution of people by year. The population weighted annual PM-2.5 in 2000 – 2002 was 9.8 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 6.8 $\mu\text{g}/\text{m}^3$, a reduction of 30.6 percent.

WEST VIRGINIA

Ozone

In the 2000 – 2002 time period, 0.39 million people (21.8%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 0.68 million people (37.1%). The remainder of the population lived in counties where ozone was not measured. The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure WV-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.085 ppm. By 2014 – 2016 this had lowered to a value of 0.065 ppm, a reduction of 23.5 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 1.0 million people (53.3%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 0.8 million people (44.1%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 µg/m3. Figure WV-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 39 µg/m3. By 2014 – 2016 this had lowered to a value of 20 µg/m3, a reduction of 48.7 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 0.3 million people (17.0%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 0.8 million people (44.1%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 µg/m3. Figure WV-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 15.9 µg/m3. By 2014 – 2016 this had lowered to a value of 8.9 µg/m3, a reduction of 44.8 percent.

WISCONSIN

Ozone

In the 2000 – 2002 time period, approximately 3.0 million people (54.9%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 3.1 million people (53.9%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure WI-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.081 ppm. By 2014 – 2016 this had lowered to a value of 0.067 ppm, a reduction of 17.3 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 2.8 million people (51.0%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 3.1 million people (53.0%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 $\mu\text{g}/\text{m}^3$. Figure WI-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 33 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 22 $\mu\text{g}/\text{m}^3$, a reduction of 33.3 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 2.8 million people (51.0%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 3.1 million people (53.0%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 $\mu\text{g}/\text{m}^3$. Figure WI-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 12.0 $\mu\text{g}/\text{m}^3$. By 2014 – 2016 this had lowered to a value of 8.3 $\mu\text{g}/\text{m}^3$, a reduction of 30.8 percent.

WYOMING

Ozone

In the 2000 – 2002 time period, approximately 19 thousand people (3.8%) lived in counties that met the ozone standard. By 2014 – 2016 this had increased to approximately 0.44 million people (74.7%). The ozone standard was lowered from 0.085 ppm to 0.070 ppm. Figure WY-1 shows the distribution of people by year. The population weighted ozone design value in 2000 – 2002 was 0.065 ppm. By 2014 – 2016 this had lowered to a value of 0.061 ppm, a reduction of 6.2 percent.

24-Hour PM-2.5

In the 2000 – 2002 time period, approximately 0.15 million people (29.3%) lived in counties where 24-hour PM-2.5 levels met the standard. By 2014 - 2016 this was approximately 0.4 million people (68.1%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 65 to 35 µg/m3. Figure WY-2 shows the distribution of people by year. The population weighted 24-hour PM-2.5 design value in 2000 – 2002 was 18 µg/m3. By 2014 – 2016 this had lowered to a value of 16 µg/m3, a reduction of 11.1 percent.

Annual PM-2.5

In the 2000 – 2002 time period, approximately 0.15 million people (29.3%) lived in counties where annual PM-2.5 levels met the standard. By 2014 – 2016 this had increased to approximately 0.4 million people (68.1%). The remainder of the population lived in counties where PM-2.5 was not measured. The standard was lowered from 15 to 12 µg/m3. Figure WY-3 shows the distribution of people by year. The population weighted annual PM-2.5 design value in 2000 – 2002 was 6.4 µg/m3. By 2014 – 2016 this had lowered to a value of 4.5 µg/m3, a reduction of 29.7 percent.
