IDEM derives the levels in Table 1 as described in IDEM's Risk-based Closure Guide Chapter 3 and Appendix A assuming a total HQ of 1 and a risk level of 10⁻⁵. Exceedance of IDEM's published levels indicates that further evaluation of potential exposure risk is appropriate.

- C = Carcinogenic endpoint
- L = Capped at 100,000 mg/kg (soil direct contact only)
- M = Set to maximum contaminant limit (MCL; ground water only)
- mg/kg = milligrams per kilogram
- N = Noncarcinogenic endpoint
- S = Capped at soil saturation limit
- µg/L = micrograms per liter; µg/m³ = micrograms per cubic meter

IDEM generally considers shallow soil gas to include samples collected no more than five feet below ground surface, and deep soil gas samples to include samples collected at more than five feet below ground surface.
