Clean Air K-2 Grade

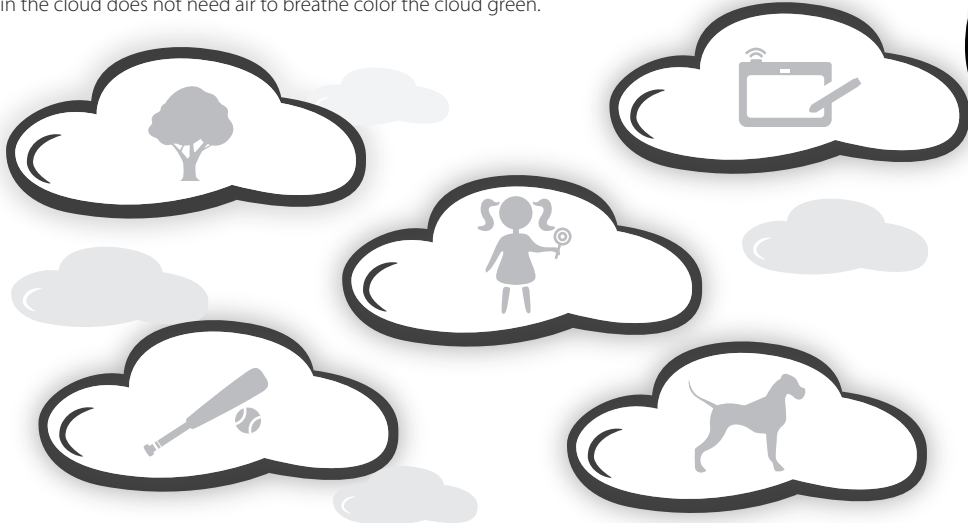

**Hi there, I'm Clean Air Kid
and I'm here to tell you all about me!**

Air is all around you, even though you may not be able to see or smell it. As air, I am a mixture of several colorless, odorless gases. The gasses, nitrogen and oxygen, make up 99% of the air around you. All life on Earth depends on air to survive.

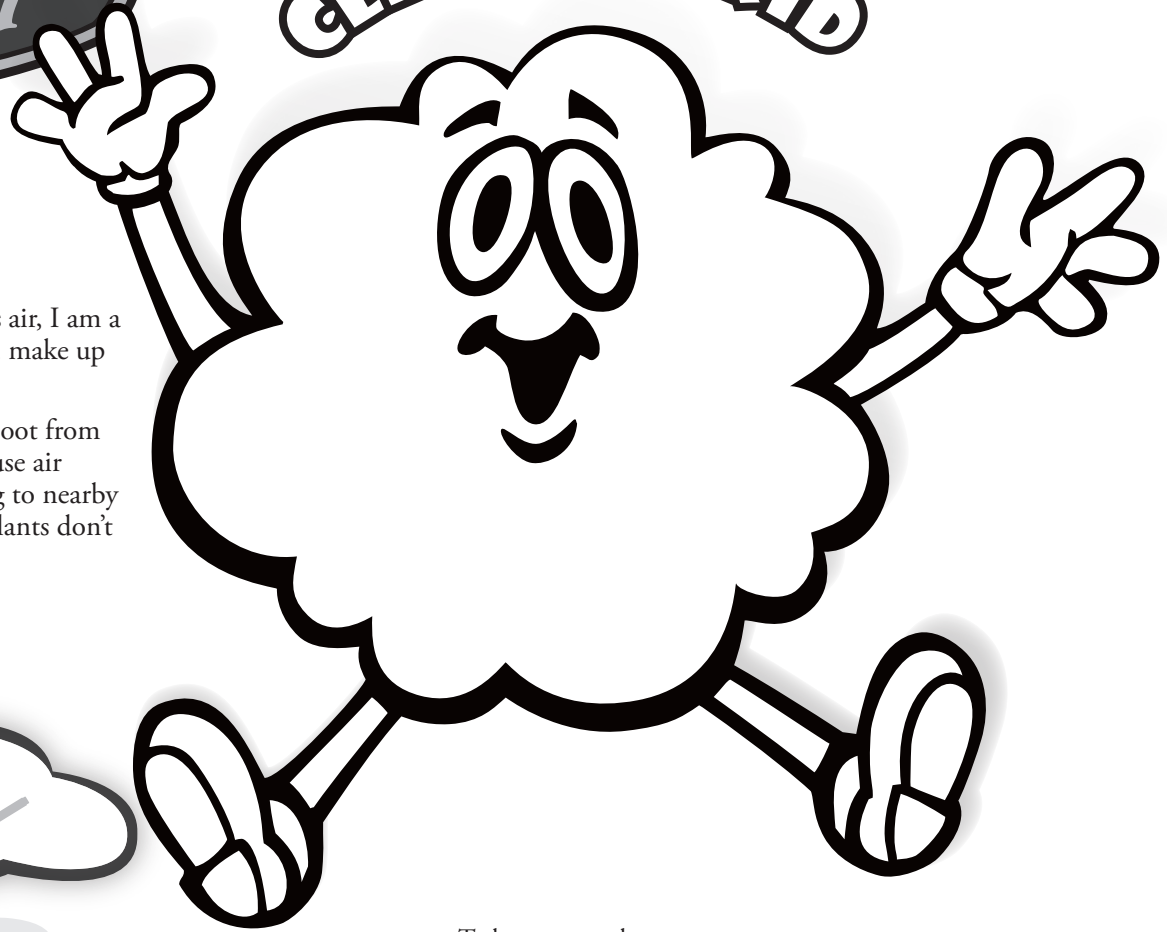

Air can become dirty, known as air pollution, for many different reasons. Soot from smokestacks, cars on the road, smoke from fires and even lightning can cause air pollution. We can all help keep the air clean by riding your bike or walking to nearby places. Conserving electricity also helps keep the air clean because power plants don't have to burn as much fossil fuel.

Instructions:

Help Clean Air Kid figure out what inside each cloud below needs air to survive. If the picture in the cloud needs air to breathe color the cloud blue. If the picture in the cloud does not need air to breathe color the cloud green.
