Wetlands, Lakes, & Streams Project Manager

Office of Water Quality Indiana Department of Environmental Management

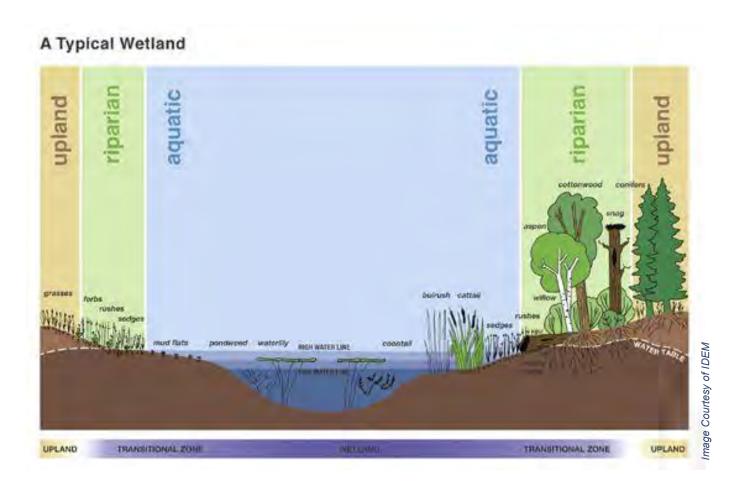

Wetlands and streams are necessary components of a healthy ecosystem.

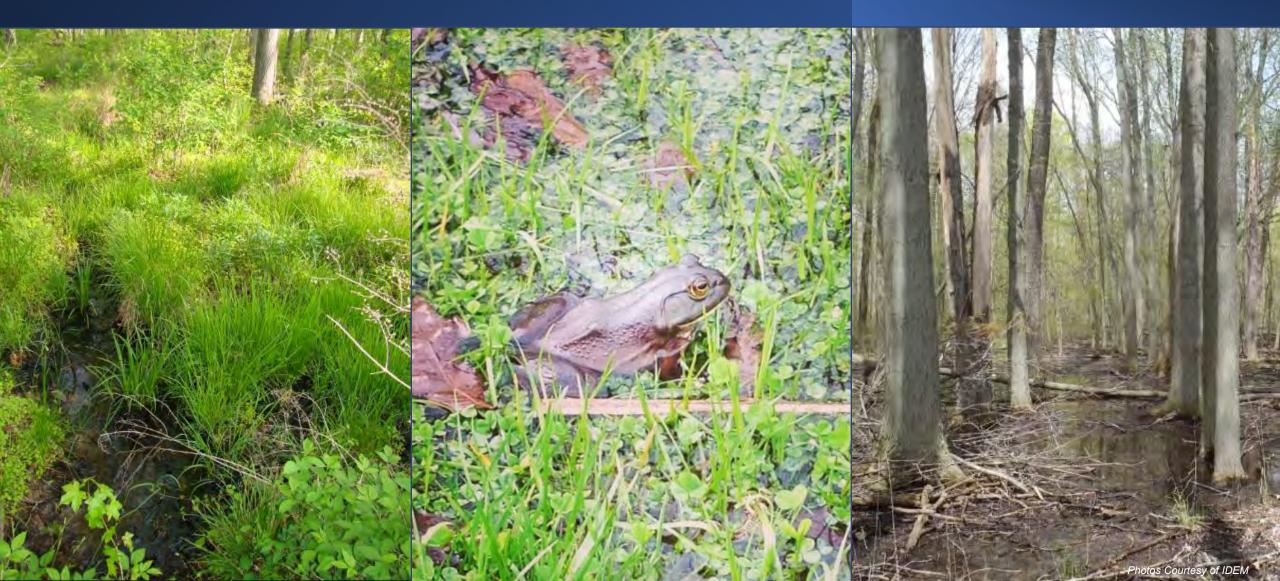

Photos Courtesy of IDEM

Wetlands - contain standing water or have water at or near the soil surface for part of, or all year, including the growing season

Different from both dry land (upland) and deep water of lakes and streams, wetlands often occur in the transitional zones between these features.

Many different types of wetland ecosystems exist in Indiana

Floodplain Forest

Wet Meadow

Shallow Marsh

Wet Prairie

How Wetlands Function

Wetlands develop in areas of poorly drained soils.

Water saturation results in reduced oxygen concentration in soils of areas flooded for prolonged periods of time.

How Wetlands Function

The process allows vegetation adapted to poorly drained soils to thrive.

How do I know if my land has wetlands?

Wetlands are defined by three criteria: vegetation, hydrology, & soils

Criteria 1: Vegetation

Nearly 5,000 different hydrophytic (water loving) plants occur in wetlands.

Criteria 2: Hydrology

Refers to the presence of water at or above the soil surface long enough to significantly influence the plant types & soils that occur in the area.

Criteria 3: Soils

Approximately 2,000 different types of hydric soils occur in wetlands across the United States.

Wetland Determinations & Delineations

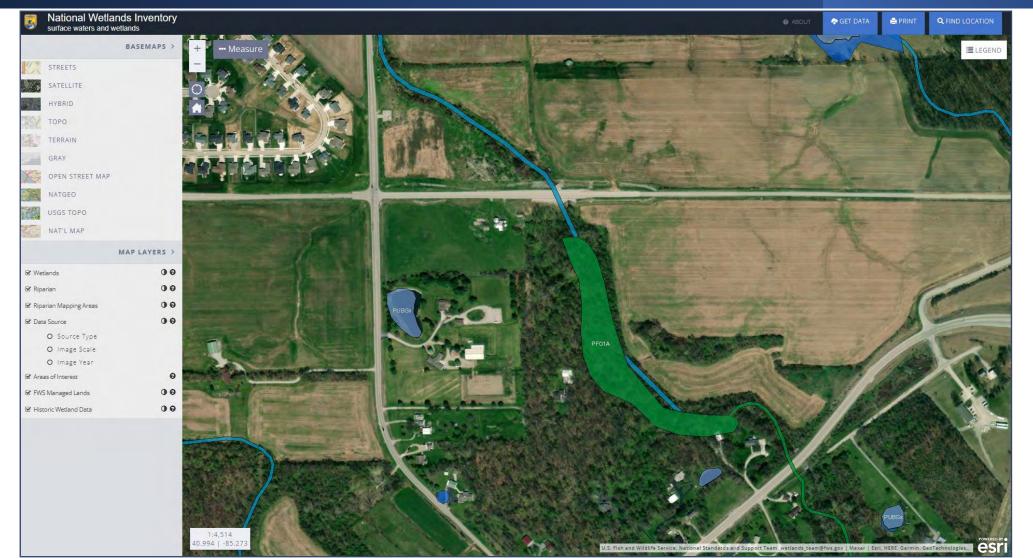

Wetlands are identified through a process known as <u>determinations</u>. <u>Delineations</u> are the process of using determination data points to identify and map the location & extent of a wetland at that time.

There are no known precise wetland maps!

National Wetland Inventory Map

Not for regulatory purposes; not field verified & not delineated What a Wetland is Not

What a Wetland is NOT

Photo Courtesy of Flick

Mosquito & monster-infested places from your worst nightmares

What a Wetland is NOT

Wetland Life Thrives Beyond Mosquitos & Monsters

What a Wetland is NOT: a Mosquito Sanctuary

Excessive mosquito populations are often a sign of stagnant water.

Things you can do:

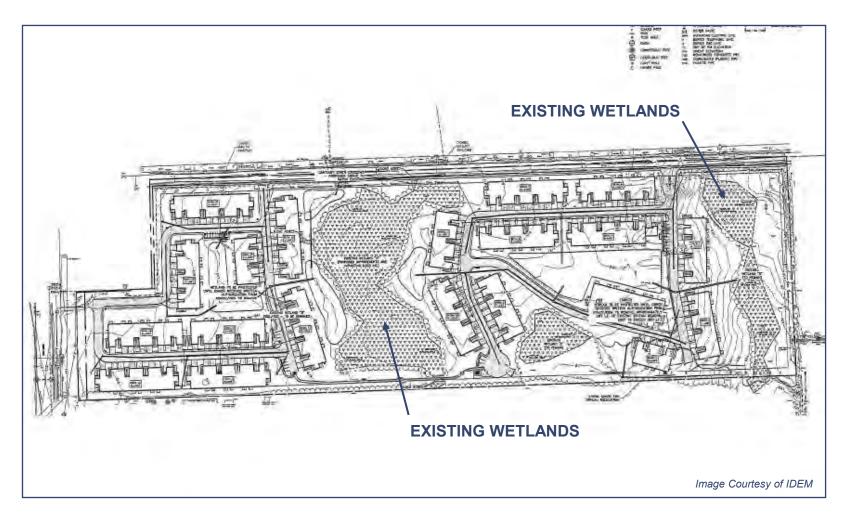

- Dispose of unwanted cans & tires
- Clean clogged roof gutters
- Drain flat roofs
- Flush sump pump pits regularly
- Change water in bird baths, fountains, & troughs twice / week
- Turn over unused wading pools & containers that collect rainwater

What a Wetland is NOT

- Detention (dry) Basin holds water temporarily after rain / storm events; slow release over time period
- Retention (wet) Pond holds water year-round; improves water quality
- **Constructed Wetlands** Artificial treatment systems that use natural processes involving wetland vegetation, soils, & their associated microbial assemblages to improve water quality (source: EPA)

What a Wetland is NOT

Myth:

Wetlands are a nuisance and an impediment to development.

Fact: Wetlands are an OPPORTUNITY.

This project development incorporated the site's existing wetlands into the surrounding greenspace.

Thank you!
