1.0 SCOPE.

1.1 This method of test covers the procedure to determine the moisture permeability of an epoxy sealer when the sealer is applied by immersion to a porous surface.

1.2 This ITM may involve hazardous materials, operations, and equipment and may not address all of the safety problems associated with the use of the test method. The user of the ITM is responsible for establishing appropriate safety and health practices and determining the applicability of regulatory limitations prior to use.

3.0 TERMINOLOGY. Definitions for terms and abbreviations shall be in accordance with the Department’s Standard Specifications, Section 101.

4.0 SIGNIFICANCE AND USE. This ITM shall be used to determine the moisture permeability of an epoxy sealer when the sealer is applied by immersion to a porous surface.
5.0 APPARATUS.

5.1 Fireclay Refractory Brick, 9 in. Class Super-Duty, Type Regular in accordance with ASTM C 27

5.2 Oven, forced draft, Type IIA, in accordance with ASTM E 145

5.3 Immersion bath, capable of temperature control at 75 ± 5°F

5.4 Scale, Class G2, in accordance with AASHTO M 231

6.0 REAGENTS.

6.1 Water, reagent grade as defined by Type II and Type III of ASTM D 1193

7.0 PROCEDURE.

7.1 Cut three quarter-brick specimens by halving the brick along a plane parallel to the 9 in. by 2 1/2 in. or 9 in. by 3 in. face and along a plane parallel to the 4 1/2 in. by 2 1/2 in. or 4 1/2 in. by 3 in. face. Four of the surfaces of the quarter-brick specimens shall include part of the original molded faces. Remove all loosely adhering particles from each specimen.

7.2 Dry the specimens overnight at 120 ± 2°F in a forced draft oven

7.3 Remove the three specimens from the oven and immerse them immediately in freshly mixed epoxy sealer. Maintain the sealer at 75 ± 5°F during the immersion period. Submerge the specimens for 25 minutes in one position, and then 20 minutes in the reverse position. Throughout the immersion cycle, the specimens shall be supported off the bottom of the container.

7.4 Following the immersion interval, remove the specimens from the container and allow them to drain on nail points or similar support. Air dry the specimens in this position for 2 to 3 h with ambient air temperature 70 to 80°F and relative humidity 40 to 60 %.

7.5 Place the air dried specimens in a forced draft oven and dry them overnight in 110 ± 2°F.

7.6 Remove the specimens from the oven, allow them to cool to room temperature, and determine the weight of each to the nearest 0.1 gram.
7.7 Place the test specimens in water and boil the specimens for 2h. During the boiling period, keep the specimens entirely covered with water, and allow no contact with the heated bottom of the container. At the end of the boiling period, shut off the heat source for the bath, and slowly feed cool distilled water into the bottom of the bath, permitting overflow or venting, until the entire bath is near room temperature.

7.8 Remove the specimens from the bath and blot them dry with clean absorbent cotton cloth of a lint free type. Determine the weight of the specimens individually to the nearest 0.1 g.

7.9 Repeat the blotting and weighing steps with each specimen until the difference between the weight is less than 0.5 g for each specimen.

8.0 CALCULATIONS. Calculate the percentage mass gain of each specimen by the following formula:

\[
\text{Percent Weight Gain} = \frac{W_w - W_d}{W_d} \times 100
\]

where:

- \(W_w\) = specimen weight after boiling and blotting
- \(W_d\) = specimen weight prior to boiling

9.0 REPORT. The percentage weight gains of the three specimens are averaged and the average is reported as the Moisture Permeability Percent.
