WORK PERFORMANCE STANDARDS

July 1, 2013
REVISED JULY 1, 2016

Work Performance Standards - List of Revisions

Revision Date	Code	Activity Name	Revision
December 1, 2013	1000	LOANED OUT	Added subactivity for Shop Work
December 1, 2013	2020	DEEP PATCHING	Corrected typo in concrete conversion
December 1, 2013	8125	PANEL SIGN INSPECTION/MAINTENANCE	Revised work method
December 1, 2013	2770	ROADWAY SWEEPING	Typo on PPE section
December 1, 2013	8510	SIGNAL PREVENTIVE MAINTENANCE	Added pedestrian ADA to checklist
December 1, 2013	2991	MAJOR SURFACE/SHOULDER IMPROVEMENTS	Added subactivity for major patching
December 1, 2013	1010	INTERNAL LOANED OUT	Clarified reporting
April 1, 2014	1020 - 1950	LEAVE ACTIVITIES	Added standards to book
April 1, 2014	2230	Herbicide Spot Treatment	Added subactivity for facilities spraying
April 1, 2014	2231	Herbicide Broadcast Treatment	Revised subactivity for invasives
April 1, 2014	2310	MAJOR CLEAN AND RESHAPE DITCHES	Clarified cleaning paved side ditch reporting
April 1, 2014	2311	SPOT DITCHING	Clarified cleaning paved side ditch reporting
April 1, 2014	2320	SMALL CULVERT INSPECTION	Added inspection form
April 1, 2014	2350	SMALL STRUCTURE CLEANING	Clarified cleaning paved side ditch reporting
April 1, 2014	2360	UNDERDRAIN CLEAN/INSPECTION	Revised inspection form
April 1, 2014	2390	OTHER DRAINAGE MAINTENANCE	Added cleaning paved side ditches to activity
April 1, 2014	2750	FULL WIDTH LITTER PICKUP	Corrected subactivity reference
July 1, 2014	Index	MANMADE AND NATURAL SNOW FENCE	Corrected numbers with name
July 1, 2014	2050	MAINLINE SEAL COAT	Added application rate form.
July 1, 2014	2190	OTHER ROADWAY AND SHOULDER MAINTENANCE	Clarified what types of work are covered
July 1, 2014	2230	HERBICIDE SPOT TREATMENT	Added subactivity
July 1, 2014	2270	SPOT MOWING	Added clarification for mowing vacant lots, added subactivities
July 1, 2014	2291	ROADWAY SLIDE MAINTENANCE	Clarify washouts > 50 tons
July 1, 2014	2390	OTHER DRAINAGE MAINTENANCE	Clarify washouts < 50 tons
July 1, 2014	2490	OTHER BRIDGE MAINTENANCE	Added subactivity for approach repair
July 1, 2014	2610	EMERGENCY MAINTENANCE	Corrected subactivity references in work method
July 1, 2014	2680	MANMADE SNOW FENCE	Added subactivity for removal
July 1, 2014	8340	RAMP OR LOT PAINTING	Added parking lot painting into this activity.
July 1, 2014	8360	SPECIAL MARKING MAINTENANCE	Removed parking lot painting from this activity. Added subactivities for specific material used.
July 1, 2014	8510	SIGNAL PREVENTIVE MAINTENANCE	Added revised QA form
July 1, 2014	8630	UNDERGROUND LOCATION WORK	Clarify report to signal/flasher commission number

Work Performance Standards - List of Revisions (Cont'd)

Revision Date	Code	Activity Name	Revision
January 1, 2015	2050	MAINLINE SEAL COAT	Modified application rate form, revised QA form
January 1, 2015	2241	SPOT SEEDING AND FERTILIZING	Corrected application rates
January 1, 2015	2310/ 2311	MAJOR DITCHING/SPOT DITCHING	Added language requiring material disposal form be attached to WO, revised QA form
January 1, 2015	2360	UNDERDRAIN CLEANING/INSPECTION	Clarified WMS online inspection form only required if followup repairs needed.
January 1, 2015	2451	PERMANENT BRIDGE DECK PATCHING	Revised QA form
January 1, 2015	2550	IMPACT ATTENUATOR/GUARDRAIL END TREATMENT REPAIR	Changed subactivities, added language about maintenance of obsolete units
January 1, 2015	2551	IMPACT ATTENUATOR/GUARDRAIL END TREATMENT INSPECTION	Added inspection form, added language about creating a work request for followup repairs
January 1, 2015	2630	SNOW AND ICE REMOVAL	Clarified comments on WO only required for special/unusual circumstances. Corrected subactivities.
January 1, 2015	8300/ 8320	PAINT CENTERLINES/PAINT EDGELINES	Modified application rate check from first 2 miles to 4, revised QA form
January 1, 2015	8510	SIGNAL PREVENTIVE MAINTENANCE	Clarified MMU changeout cycle
April 1, 2015	2010	PERMANENT SHALLOW PATCHING	Split this activity into "permanent" and "temporary"
April 1, 2015	2011	TEMPORARY SHALLOW PATCHING	Split this activity into "permanent" and "temporary"
April 1, 2015	2050	MAINLINE SEAL COAT	Clarified wording to more closely match specifications, added info on CRS 2P
April 1, 2015	2090	MAINLINE CRACK ROUTE AND SEAL	Revised to align with new Activity 2095
April 1, 2015	2095	RESEALING CONCRETE PAVEMENT JOINTS	New activity for concrete joint sealing.
April 1, 2015	2190	OTHER ROADWAY AND SHOULDER MAINTENANCE	Added subactivities for typical uses of this activity
April 1, 2015	2210	MOWING	Added language to report mowing native vegetation to this activity, added subactivity for this.
April 1, 2015	2220	MANUAL BRUSH CUTTING	Added diagrams to help in measurement of square feet.
April 1, 2015	2221	MECHANICAL BRUSH CUTTING	Added diagrams to help in measurement of square feet.
April 1, 2015	2350	MANUAL DRAIN CLEANING	Split this activity into "manual" and "mechanical" to differentiate simply cleaning leaves vs. utilizing a vac truck
April 1, 2015	2351	MECHANICAL SMALL STRUCTURE CLEANING	Split this activity into "manual" and "mechanical" to differentiate simply cleaning leaves vs. utilizing a vac truck
April 1, 2015	2470	BRIDGE DECK CRACK FILLING	New activity for filling cracks in concrete bridge decks
April 1, 2015	2471	BRIDGE DECK BROADCAST SEALING	New activity for spray sealing concrete bridge decks
April 1, 2015	2690	OTHER WINTER MAINTENANCE	Changed reporting of clearing drains to Activity 2350.
April 1, 2015	8530	SCHEDULED SIGNAL/FLASHER INDICATION REPLACEMENT	LED changout cycle has changed from 6 to current policy.
April 1, 2015	8560	SIGNAL/FLASHER EQUIPMENT REPLACEMENT/REPAIR	Added subactivity and work method for overhead inspections.

Work Performance Standards - List of Revisions (Cont'd)

Revision Date	Code	Activity Name	Revision
October 1, 2015	2010	PERMANENT SHALLOW PATCHING	Remove reference to cold mix.
October 1, 2015	2015	MAINLINE FOG SEAL	Updated wording for better clarity.
October 1, 2015	2070	MAINLINE CRACK FILLING	Revise to match new crack treatment guidance.
October 1, 2015	2071	SHOULDER CRACK FILLING	Revise to match new crack treatment guidance.
October 1, 2015	2090	MAINLINE CRACK ROUTE AND SEAL	Revise to match new crack treatment guidance.
October 1, 2015	2091	SHOULDER CRACK ROUTE AND SEAL	Revise to match new crack treatment guidance.
October 1, 2015	2095	RESEALING CONCRETE PAVEMENT JOINTS	Revised diagrams and material requirements.
October 1, 2015	2220	MANUAL BRUSH CUTTING	Added reporting guidance based on new activity for storm debris removal.
October 1, 2015	2551	IMPACT ATTENUATOR/GUARDRAIL END TREATMENT INSPECTION	Added reporting guidance on inspection form, more detail on end treatment inspections.
October 1, 2015	2610	EMERGENCY MAINTENANCE	Added clarification for purpose and reporting
October 1, 2015	2611	STORM DEBRIS REMOVAL	New activity for removing storm debris from R/W.
October 1, 2015	2760	SPOT LITTER PICK UP	Added reporting guidance based on new activity for storm debris removal.
October 1, 2015	2890	OTHER SUPPORT ACTIVITIES	Corrected subactivity.
October 1, 2015	PREFACE	EQUIPMENT REPORTING	Added guidance on reporting equipment hours. Revised index with new activities.
July 1, 2016	PREFACE	WORK ORDERS	Revised guidance on work order comments. Added section on calling in utility locates.
July 1, 2016	2010	PERMANENT SHALLOW PATCHING	Removed cold mix as a material, added roller to equipment.
July 1, 2016	2020	DEEP PATCHING	Added guidance on calling utility locates.
July 1, 2016	2070	MAINLINE CRACK FILLING	Revised ADP.
July 1, 2016	2090	MAINLINE CRACK ROUTE AND SEAL	Revised ADP.
July 1, 2016	2190	OTHER ROADWAY AND SHOULDER MAINTENANCE	Added guidance on calling utility locates.
July 1, 2016	2220	MANUAL BRUSH CUTTING	Added details on reporting when work performed near a bridge.
July 1, 2016	2320	SMALL CULVERT INSPECTION	Added references, details on birds/bats, updated inspection and inventory forms.
July 1, 2016	2336	PIPE LINING - SMALL PIPE	Added guidance on calling utility locates.
July 1, 2016	2337	PIPE LINING - LARGE PIPE	Added guidance on calling utility locates.
July 1, 2016	2390	OTHER DRAINAGE MAINTENANCE	Added guidance on calling utility locates.
July 1, 2016	2410	BRIDGE CLEANING	Revised ADP.
July 1, 2016	2440	BRIDGE FLUSHING	Revised ADP.
July 1, 2016	2550	IMPACT ATTENUATOR/GUARDRAIL END TREATMENT REPAIR	Added guidance that if completely replacing a unit, does not have to be the same brand as existing.

Work Performance Standards - List of Revisions (Cont'd)

Revision Date	Code	Activity Name	Revision
July 1, 2016	2590	OTHER SAFETY DEVICE MAINTENANCE	Took out guidance on marking of control points. That work should be reported to the marking activity.
July 1, 2016	2610	EMERGENCY MAINTENANCE	Corrected typo.
July 1, 2016	7000	SUPPORT WORK ASSIGNMENTS	Added guidance that teambuilding type activities may be reported to this activity.
July 1, 2016	8100	SHEET SIGN MODERNIZATION	Corrected typo.
July 1, 2016	8110	SHEET SIGN MAINTENANCE	Added guidance on calling utility locates. Added direction about NOT installing signs on utility poles.
July 1, 2016	8140	DELINEATION MAINTENANCE PROGRAM	Added guidance on calling utility locates.
July 1, 2016	8300	PAINT CENTERLINE	Added guidance on marking/reporting control points. Revised application rate form.
July 1, 2016	8320	PAINT EDGELINES	Added guidance on marking/reporting control points. Revised application rate form.
July 1, 2016	8510	SIGNAL PREVENTIVE MAINTENANCE	Added guidance on joint railroad inspections for preemption.

Introduction

INDOT’s maintenance forces perform numerous work activities throughout the state, from pothole patching to signal repairs, by over 100 management units and over 1,000 employees. Consistent work methods and accurate reporting are essential to getting the job done, at the highest quality and lowest cost possible.

The purpose of these work performance standards is to ensure that our maintenance work is done correctly and reported properly. Many of our activities have unit cost goals and quality assurance reviews. By following the work method, the resulting job should meet or exceed the cost and quality goals.

Traffic Control

INDOT’s Workzone Traffic Control Handbook should be utilized to plan the traffic control plan for each specific project. Since traffic control varies, traffic control equipment and crew are not shown in the standards, but still need to be planned for and reported into WMS.

The standards only show job-specific equipment and crew necessary to perform the specific work regardless of traffic control.

Safety

INDOT recognizes its responsibility to provide a safe working environment. This should include making reasonable efforts to promptly investigate and address safety issues, not allowing employees to perform unsafe tasks and providing adequate training and safety equipment. All employees are required to use the appropriate personal protective equipment (PPE) per work performance standards.

“Base PPE” in these standards is defined as:

- Approved High Visibility Vest or Shirt
- Approved High Visibility Soft Cap.
- Approved Hard Toe and Hard Soled Work Boots
- Safety Bag inclusive of Hard Hat, Gloves, Hearing Protection and Eye Protection

The performance standards will indicate “Base PPE” for specific activities. Supervisors will be responsible for providing competent review of all safety hazards through the daily safety briefing inclusive of proper use of “Base PPE” and any additional listed specialized PPE. Supervisors will be responsible for ensuring any employee assigned to operate equipment/vehicles listed have been provided adequate training.

Work Orders

Most activities should be considered individual jobs or projects and be recorded on one work order, regardless of how many days it takes to complete the job. For example, a pipe replacement job that takes 3 days (cut pavement day 1, install pipe day 2, patch over cut day 3) shall be 1 work order, not three. Likewise, on a seal coat job all work shall be on one work order, including sign/detour placement, RPM protection, seal coat construction and final sweeping.

Certain activities don't have obvious start and end points (examples include mowing, resigning and restriping). For these types of activities, use a logical timeframe for the work order – if a crew is working in a specific area for the week, that could be a single work order. Depending on the work, duration, and location, the work order could be a single day, week, or pay period.

All work orders, other than overhead activities, are required to have comments. The comments should include details on any special considerations that happened during the job, or specific work performed on an “other” activity. If a question comes up several months after the work is done, the comments should be able to answer it.

Underground Locates

Any work that could result in utility damage must have an underground utility locate submitted at least 2 business days in advance. This includes not only excavation, such as ditching, but also removal or installation of sign or fence posts. See <http://indiana811.org/> for more details.

Note that INDOT facilities (such as signal interconnect, lighting wiring, ITS, etc.) are NOT included in 811. Contact your District Traffic section if excavating in the vicinity of INDOT equipment.

Equipment Reporting

All equipment used on a job should be reported on the work order, for the duration of the job, regardless of how long it was actually used. For example, a backhoe used on a pipe replacement (2311) job for an entire 7.5 hour day would be shown on the work order for 7.5 hours, even if it was only operated for 2 hours.

An exception would be if the equipment was on one job, then moved to another. For example, a backhoe was 3 hours on a pipe job, then moved for the rest of the day to a patching job, the pipe work order would show 3 hours, and the patching work order would show 4.5.

Rental equipment needs to be shown on the work order in the same manner, with the actual daily rental fee shown as the cost. If equipment is rented by the month, the daily cost is calculated by dividing the monthly fee by 20. If rented by the week, divide the weekly fee by 5.

Work Performance Standard Template

Each standard contains the following information about the specific activity:

1. **Purpose** – *What the activity is for, and why we are doing it.*
2. **Category** – *Roadway/Drainage, Right-of-Way, Non-Road, or Overhead; and whether the activity is a Preventive Maintenance, has an associated Quality Assurance review, has a Unit Cost Goal, and should be pre-planned locations.*
3. **Scheduling and Coordination** – *Information on when an activity is typically performed considering seasonal, temperature, or other limitations. Also includes other activities to coordinate with.*
4. **Reporting** – *Details on how to report accomplishment, as well as guidance on what should be reported to different activities.*
5. **Reporting Units** – *The units the specific activity is measured in.*
6. **Crew Size** – *Job specific, typical crew size to perform the specific activity. Traffic control personnel are not shown here.*
7. **Job Specific Equipment** – *Job specific, typical equipment to perform the specific activity. Traffic control equipment is not shown here.*
8. **Materials** – *Typical materials for the specific activity, as well as INDOT specification references.*
9. **PPE** – *Specific Personal Protective Equipment for the activity being performed.*
10. **Other References** – *Alternate sources of information relevant to the specific activity. Includes INDOT specification references, policies, handbooks, etc.*
11. **Sub Activities** – *Description of sub activities for the specific activity.*
12. **Work Method** – *Detailed guide on how to perform the specific activity.*
13. **Special Considerations** – *Any other tips for the specific activity.*

Average Daily Production		Person Hours		EFFECTIVE DATE		4/1/2014	

ACTIVITY	Holidays	CODE	1360
-----------------	----------	-------------	------

Work Method	
--------------------	--

Special Considerations

Employees are eligible to receive compensation for holidays in the following circumstances:

- Employee is full-time, part-time, or hourly occupying a permanent position; and
- Employee is in pay status during the calendar week in which the holiday is observed; however,
- Employees are not eligible to receive compensation for holidays observed prior to the first work day of employment or after the last work day of employment.

A full-time, part-time, or permanent positioned employee is required to work on a date that a holiday is observed for his/her assigned operation, the employee is entitled to appropriate payment for such hours worked and, in addition, may choose to have the holiday compensation with the regular compensation for that pay period or may choose compensatory time off to be used on another date. Temporary and intermittent employees who are required to work on an observed holiday will receive the appropriate compensation for the hours worked, but are not entitled to any additional compensation under this policy.

The Governor will annually set the dates of observance for legal holidays which will be communicated prior to the start of the calendar year.

INDIANA DEPARTMENT OF TRANSPORTATION
DIVISION OF MAINTENANCE
WORK PERFORMANCE STANDARD

ACTIVITY	Permanent Shallow Patching		CODE	2010
Purpose	Permanent repair of minor patching of small areas of bituminous roadway or shoulder surface, where the depth of the patch is not greater than the thickness of the pavement. Patching should be completed with hot mix asphalt or asphalt emulsion and aggregate to correct potholes, edge failures, and other potential surface hazards to delay further deterioration of the surface.		Category	Roadway/Drainage
			<input type="checkbox"/> PM <input checked="" type="checkbox"/> QA <input checked="" type="checkbox"/> Unit Cost <input type="checkbox"/> Plan Location	
Scheduling & Coordination				
Repair surface failures exceeding 1" in depth and 1' in diameter as soon as possible after they are reported. Other surface failures, which do not present a hazard to traffic, should be scheduled as routine maintenance prior to the beginning of inclement weather, which is typically November 1 st .				
Reporting			Reporting Units	Short Tons
Accomplishment is reported in STN – Short Tons. STN (Short Tons) is equal to 2,000 lbs. Accomplishment should be reported as the total of all material quantities (HMA, asphalt emulsion, etc.) added together. This activity is for permanent patching of the roadway which requires additional work such as squaring the patch area and the use of asphalt emulsion for a tack coat. If the distressed area is simply patched with material and compacted, it should be reported to Activity 2011 – Temporary Shallow Patching. If the sub-grade is removed and replaced during the patch, it should be reported to Activity 2020 – Deep Patching.

ACTIVITY	Permanent Shallow Patching	CODE	2010
----------	----------------------------	------	------

Work Method

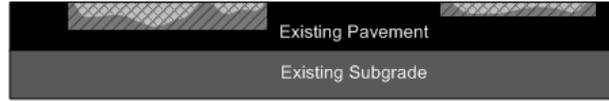

1. Place signs and safety devices.

Using an Asphalt Storage Trailer

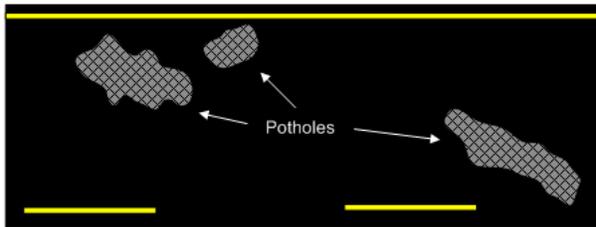

2. Use a pavement saw, grinder or jackhammer to cut a rectangular outline of the patch area.

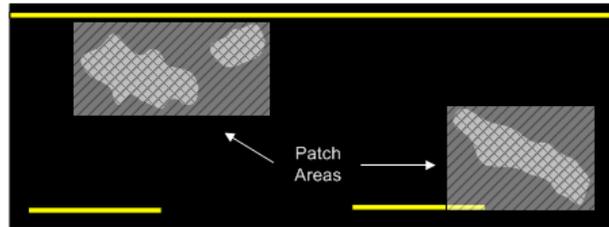

Elevation View

Elevation View

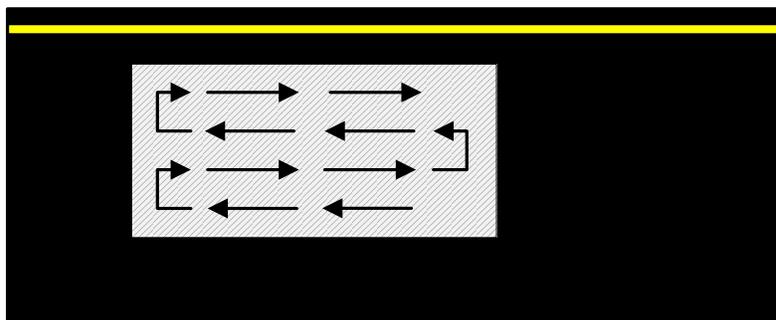

Plan View

Plan View

3. Remove all old material from the patch area.
4. Tack both the bottom and the sides of the patch area with asphalt emulsion.
5. Place asphalt in the patch in appropriate lifts.
 - For intermediate asphalt, 2 – 4 inches per lift
 - For surface asphalt, 1 – 2 inches per lift
6. Compact each lift with a roller or vibratory compactor for large patches or a hand tamper for small patches.
7. On the final lift, lute the top of the patch slightly higher than the surrounding pavement before compacting it.
8. When compacting, roll and vibrate (if possible) the asphalt longitudinally with the lane starting at high side and working toward the low side with overlapping passes.

9. The surface should be flush to within 1/4" higher than the original pavement after compaction.
10. Remove all signs and safety devices.

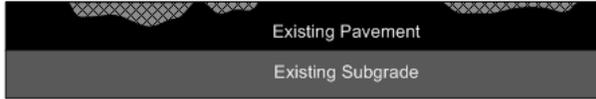

ACTIVITY	Permanent Shallow Patching	CODE	2010
-----------------	-----------------------------------	-------------	-------------

Work Method (continued)

Using a Spray Injection Patcher

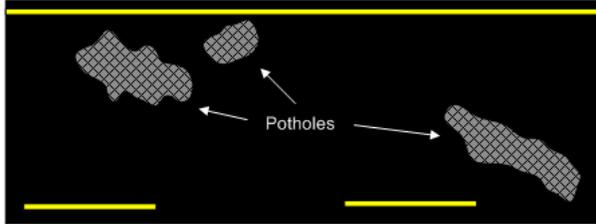

- Use a pavement saw, grinder or jackhammer to cut a rectangular outline of the patch area.

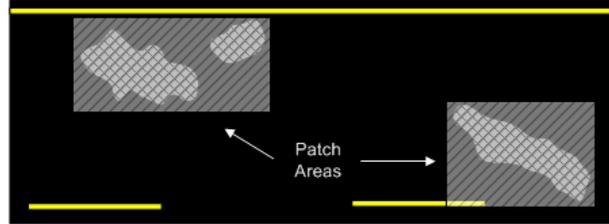

Elevation View

Elevation View

Plan View

Plan View

- Blow water and any loose debris from the patch area.
- Tack both the bottom and the sides of the patch area with asphalt emulsion.
- Spray the asphalt emulsion and aggregate mixture into the patch area.
- Cover the asphalt emulsion and aggregate mixture with a thin layer of uncoated aggregate.
- Remove all signs and safety devices.

Special Considerations

If the distressed area is prepped prior to being patched, which includes squaring the distressed area and removing any loose debris, it is permanent shallow patching. Temporary patches typically require minimal, if any, prep work and consist of placing material in the pothole and tamping it.

Hand tools include but are not be limited to the following:

- Pavement saw
- Jackhammer with air compressor
- Vibratory compactor
- Vibrating plate
- Shovels
- Rakes
- Push brooms
- Lutes
- Hand tampers

Sub Activities			
Average Daily Production	11 - STN(Short Ton)	EFFECTIVE DATE	July 1, 2016

**ACTIVITY****Deep Patching****CODE****2020****Work Method**

Note: All deep patching activities on Interstate Highways shall have prior approval by District Pavement Engineer

1. Call in a locate to Indiana811. This should be done 2 business days before any excavation begins.
2. Place signs and other safety devices.
3. Mark out the extent of the area to be patched. The outline should be rectangular with two sides at right angles to the direction of traffic. Make sure that the repair extends at least 1 foot into the sound adjacent surface. Patch size should be a minimum 2 ft X 2ft .With a pavement saw or pneumatic hammer, cut the outline of the patch.
4. Excavate the patch to the underside of the base layer and check the quality of the underlying sub-base by visual assessment. If the excavation reveals unstable subgrade material, such material should be removed to a minimum depth of 6 inches. Re-compact remaining materials and then replace removed material with No. 53 aggregate and compact.
5. Check the excavation for subsurface water and if present the installation of subsurface drains (Standard Drawing No. E 608-SHDR-01) may be required. **Contact District Pavement Engineer for approval/recommendation of subsurface drainage method.**
6. Square up the sides of the patch area until vertical sides exist in reasonably sound pavement.
7. Apply tack coat , emulsified asphalt, or liquid asphalt to vertical faces of excavation.
8. Dump and spread bituminous mixture in lift depths according to following table:

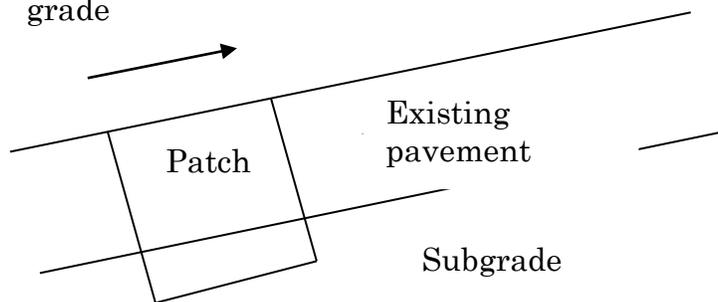

Single Lift Depths (Note: Compact each lift thoroughly before adding next lift material)

Mix size	Minimum Thickness	Maximum Thickness
9.5mm	1.0"	2.0"
12.5mm	1.5"	3.0"
19.0mm	2.0"	4.0"
25.0mm	3.0"	6.0"

Place the mixture against the edges of the hole first (rather than in the center and then raking to the edges). Avoid pulling the material from the center of the patch to the edges. If more material is needed at the edge, it should be deposited there and the excess raked away. The amount of mixture used should be sufficient to ensure that after compaction, the patch surface will not be below that of the adjacent pavement. On the other hand, if too much material is used, a hump will result.

9. Compact each lift of the patch thoroughly. Use equipment that is suited for the size of the job. A vibratory plate compactor is excellent for small jobs, while a vibratory roller is likely to be more effective for larger areas.
10. When compacting the final lift , the edge of the patch should always be compacted first, followed by compacting the remaining patch area in the direction of traffic. Previous compacted areas should be overlapped by about 6 inches.. If there is a grade, compaction should proceed from the low side to the high side to minimize possible shoving of the mix.

Direction of
compaction when on
grade

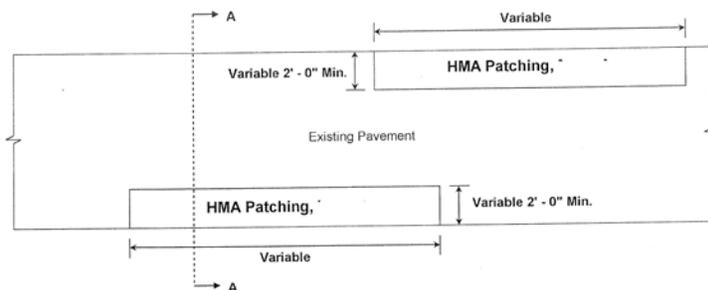

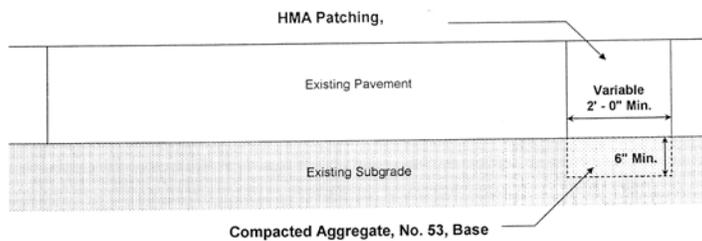

ACTIVITY	Deep Patching	CODE	2020
-----------------	----------------------	-------------	-------------

11. Check the vertical alignment and smoothness of the patch with a straight edge or stringline.
12. Clean up work area- sweep loose material away from patched area and off road surface.
13. Remove signs and safety devices.

BEST PRACTICES FOR LETTING HMA COOL ACTIVITIES 2010, 2020, 2030

To assist in determining the appropriate cooling methods, the Division of Maintenance has put together best practices for HMA cooling prior to allowing traffic. Below is a website that can be utilized when determining the appropriate cooling times for HMA, given the current conditions at the site.

http://www.hotmix.org/index.php?option=com_content&task=view&id=178&Itemid=272.

Best Practices:

- The best cooling practices, for a permanent fix or an interim fix, is to let the HMA cool on its own and check temperatures at the site after the HMA is placed and do not cool the HMA with water. It is imperative that any permanent fix follows this practice for cooling, since rapid cooling could be detrimental to the HMA (See “CAUTION” note below).
- To return traffic on the HMA the temperature should be 175°F or less
- HMA mixture will resist compaction within the temperature range of 170°F -180°F
- For a patch that would be considered an interim fix until a more permanent fix is in place, cooling with water may be applicable to return the traffic sooner. Just ensure that rolling and compacting is done PRIOR to placing water. Also, if the patch involves multiple lifts, it is important that any standing water or steam has been removed so that the next lift is not placed on standing water or steam is trapped between lifts.
 - CAUTION: Cooling with water may be detrimental to the HMA performance as it could cool the HMA too quickly and cause density issues, or if water is applied at or above 212°F a steam may form as the water is boiled off and may cause raveling or rutting if the bond is broken between the asphalt cement and the aggregate. If the bond is not broken the steam could still cause premature aging of the asphalt and create a cracking issue with the pavement.

The following are examples from the above website:

- 9AM, 80 degree day, humid and hazy, 5 mph wind speed, 1.5” HMA on granular base, 300 degree initial temp takes 23 minutes to cool to 175 degrees
- 3PM, 75 degree day, clear and dry, 10 mph wind speed, 2” HMA on concrete, 300 degree initial temp takes 32 minutes to cool to 175 degrees.
- 2PM, 65 degree day, mostly cloudy, 15 mph wind speed, 3” HMA on granular base, 300 degree initial temp takes 43 minutes to cool to 175 degrees

INDIANA DEPARTMENT OF TRANSPORTATION
DIVISION OF MAINTENANCE
WORK PERFORMANCE STANDARD

ACTIVITY	Spot Paving	CODE	2030
Purpose	Spot paving is used to report machine paving of isolated areas of bituminous or concrete roadway and shoulder surfaces. Hot bituminous mixtures are applied to correct depressions at bridge ends, surface failures, and depressions caused by settlement at pipe replacements and deep patches.	Category	Roadway/Drainage
			<input type="checkbox"/> PM <input checked="" type="checkbox"/> QA <input checked="" type="checkbox"/> Unit Cost <input checked="" type="checkbox"/> Plan Location
Scheduling & Coordination			
<p>Schedule the repair of those deficiencies causing a hazardous ride at the posted speed limit. Paving of long sections to correct minor crown deficiencies, settlement between paved shoulder and road surfaces, rutting and grade depressions should be scheduled by material and equipment availability. Do not do within 2 years of upcoming road project.</p> <p>Coordinate with Traffic for pavement markings if applicable.</p>			
Reporting		Reporting Units	Tons
<p>Accomplishment shall be reported in tons of premix</p> <p>New pavement in new locations, such as turn lanes or deceleration lanes are reported to Activity 2991- Major Surface/Shoulder Improvements</p> <p>Continuous paving greater than ½ mile would be considered a “capital project” and should be reported to Activity 2991- Major Surface/Shoulder Improvements</p>

Sub Activities			
Average Daily Production	105 Tons	EFFECTIVE DATE	July 1, 2013

ACTIVITY	Spot Paving	CODE	2030
-----------------	--------------------	-------------	-------------

Work Method

1. Place signs and safety devices
2. Mark approximate limits of area to be wedged using string line or straight edge
3. Mill transition areas (Butt joints)
Butt joints allow the pavement thickness to continue all the way to the edges and avoids feathering or thinning down asphalt to meet connections.
4. Sweep surface to remove loose material (as required)
5. Apply a bituminous tack coat on area to be leveled
6. Spread bituminous mixture in lifts of not more than 3 "
7. Compact bituminous mixture
Compaction operations will begin at low side and proceed to high side. The roller wheel shall overlap previous pass by a minimum of 6". Roller speed shall be limited to < 3mph. Compaction temperature range is 185 °F to 300 °F
8. Make sure the final layer matches the existing surface and pavement edge. Check with a string line or straight edge to make sure the final surface will provide smooth riding
9. Clean up the work area and sweep loose material off road surface
10. Seal butt joints with asphalt emulsion.
11. Remove signs and safety devices

Special Considerations

High cost activity.

INDIANA DEPARTMENT OF TRANSPORTATION
DIVISION OF MAINTENANCE
WORK PERFORMANCE STANDARD

ACTIVITY	Full Width Shoulder Seal Coat	CODE	2040
Purpose	Seal Coating of continuous full width sections of paved or aggregate shoulder surface with a single application of hot liquid bituminous material and aggregate chips. This treatment is used to address low to moderate severity cracking, oxidation, seal the surface, and extend shoulder life.	Category	Roadway/Drainage
		<input checked="" type="checkbox"/> PM <input type="checkbox"/> QA <input type="checkbox"/> Unit Cost <input checked="" type="checkbox"/> Plan Location	
Scheduling & Coordination			
This work should be scheduled on shoulders with low to moderate cracking, oxidation, or drying out of bituminous material. Schedule this work in conjunction with supporting operations to be completed prior to sealing, such as squeegee sealing or patching. The shoulder in most cases should not be sealed by seal coat before May 1 or after October 1. The pavement surface and ambient temperature should be over 60°F. Coordinate pavement striping with Traffic.			
Reporting		Reporting Units	Foot Miles
Accomplishment shall be reported in FTM- Feet Mile. FTM (Foot Mile) is width of shoulder (ft) X miles completed (mi). Reporting should include prep work such as placing advance signage, covering of pvmt markings in preparation for sealing and any other prep work. No accomplishment is reported for these items. Shoulder sealing of 2' or less done in the same operation as mainline seal coat should be reported to Activity 2050. Conversion of gallons of liquid bituminous to tons is equal to (# gallons)/ 236. Double or Triple application seal coat is reported to Activity 2991.

ACTIVITY	Full Width Shoulder Seal Coat	CODE	2040
-----------------	--------------------------------------	-------------	-------------

Special Considerations

Approval from Technical Services (District Pavement Engineer) is required before seal coat placement on shoulder greater than 2 feet wide.

Calibration of seal coat equipment is a critical practice that should be conducted prior to seal coat. Calibration of seal coat equipment is a critical practice that should be conducted prior to seal coat. The aggregate spreaders, distributors, and rollers are equipment which needs calibration.

Traffic should not be allowed on a seal coat surface until after rolling and after the bituminous material has set and cured. Typically 45 minutes to 2 hours.

Dry pavement, no rain forecast for at least 24 hours

The pavement surface and ambient temperature should be over 60°F.

Haul trucks: avoid turns, watch speed, and watch for aggregate leakage

Haul Trucks =

**ACTIVITY****Shoulder Fog Seal****CODE****2041****Work Method**

1. Place signs and safety devices
2. Cone off lanes for any long closures
3. Existing pavement should be cleaned by brooming operation
4. Cover all castings, detector housing and rpm's
5. Apply liquid bituminous material with Distributor at maximum speed of 5 mph. The emulsion application rate typically ranges from 0.10 to 0.15 gal/yd². The emulsion should be applied uniformly at a rate within ± 0.02 gal/syd of the target application rate.
6. Fine aggregate should be applied to pedestrian cross-walks, drive-ways, or other areas where traffic needs to cross fresh seal prior to emulsion cure.
7. Applied emulsion should be sufficiently cured before traffic is permitted to avoid tracking. Curing will depend on environmental factors, but traffic can typically be restored in 30 minutes.
8. Coordinate with traffic for final markings
9. Clean/uncover rpm's
10. Remove signs and safety devices

Special Considerations

Streaks in the fog seal indicate a clogged nozzle or an improper overlap of spray from adjacent nozzles. The problem needs to be corrected prior to proceeding with the application of the fog seal

Emulsion should be evenly distributed with the target application rate.

Ambient air or Pavement temperature should be minimum 60 degrees with no rain forecast for 24 hours

Must use correct nozzles -Etnyre #3353788

Work Method				
<ol style="list-style-type: none"> Prior to the start of the job, place all necessary signs and traffic control devices for any closures and detours. Coordinate the chip seal schedule from beginning to end with Traffic. Place all necessary signs and traffic control devices for road construction. Close the road/lane to traffic. If the chip seal will be constructed under traffic, the use of a pilot vehicle to control traffic speeds is encouraged. Sweep the roadway surface of any loose debris in front of the distributors. Install temporary pop-up rpm reflectors, if necessary. Cover all rpms, castings and detector housings with sand or temporary tape. Spray heated ($\approx 150^{\circ}\text{F}$) asphalt emulsion (ie. AE-90S) at the appropriate rate to match the speed of the aggregate spreader. Apply even coverage while avoiding excessive stops as much as possible, to prevent unnecessary joints. Ensure that the nozzles are orientated at the same angle to achieve even application. 				
<p>The diagram shows two scenarios for nozzle spray patterns. On the left, labeled 'Same Angle', four nozzles are shown with their spray fans oriented at the same angle, resulting in four uniform, overlapping spray fans. On the right, labeled 'Different Angles', the same four nozzles are shown but with their spray fans oriented at different angles, resulting in four irregular, overlapping spray fans of varying widths.</p>				

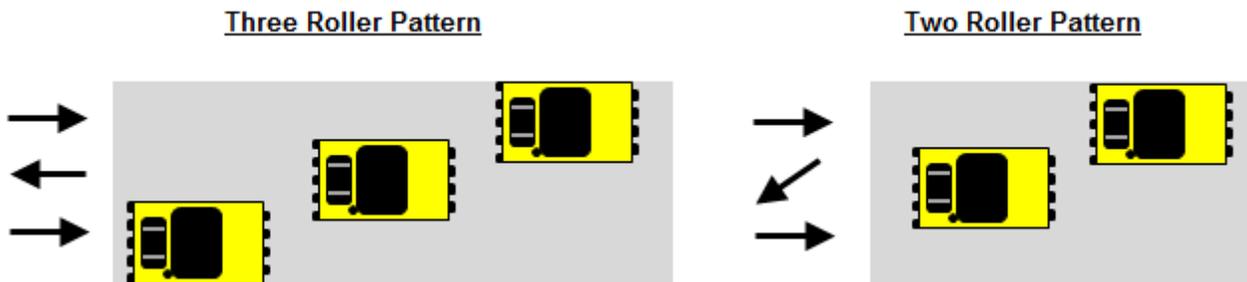

ACTIVITY	Mainline Seal Coat	CODE	2050
-----------------	---------------------------	-------------	-------------

Work Method (continued)

- Within 1 minute**, spread a single layer of aggregate onto the asphalt emulsion. Do **NOT** allow the asphalt emulsion to break before the aggregate is spread onto the roadway to allow for proper embedment of the aggregate.

Material	Typical Application Rates	
	Aggregate	Asphalt Emulsion
SC 11	16 - 20 lb/yd ²	0.36 - 0.40 gal/yd ²
SC 12	14 - 17 lb/yd ²	0.29 - 0.33 gal/yd ²
SC 16	18 - 20 lb/yd ²	0.36 - 0.40 gal/yd ²

- The first pneumatic roller pass should be completed **within 2 minutes** of the aggregate being applied.
- The pneumatic rollers should make **at least 3 passes** with the final rolling taking place **within 30 minutes** of the aggregate application.

- No later than the morning after placement chip seal**, the road surface should be swept to remove excess aggregate from the pavement.
- If the road will be fog sealed, all future work should be reported to Activity 2051 - Mainline Fog Seal.
- After completion of the chip seal, all rpms should be uncovered and cleaned.
- Coordinate with Traffic to schedule the painting of the final markings.
- After the new traffic lines are painted, remove all signs and traffic control devices.

Special Considerations

Planning

Calibration of the chip seal equipment is critical to the success of the chip seal operation. The distributors (application rate), aggregate spreader (application rate) and pneumatic rollers (tire pressure and weight) should be properly calibrated **at minimum** at the beginning of the construction season.

When stockpiling SC aggregate, take care to stock the aggregate on hard surfaces away from dust or mud contamination. SC aggregate is a premium material due to it being manufactured cleaner. Loader operators need to ensure they are using proper loading techniques, which include not dipping into underlying dirt, stone or other contamination. Operators should also handle the material a minimal number of times.

CRS-2P has a different chemical composition that is incompatible with our traditional emulsions, such as AE-90S or AE-F. Residual materials **must be thoroughly cleaned** from the distributor tank and spray bar when switching to CRS-2P or from CRS-2P.

ACTIVITY	Mainline Seal Coat	CODE	2050
-----------------	---------------------------	-------------	-------------

Special Considerations (continued)

Make note of the existing pavement markings including the lane width. Coordinate with Traffic to ensure proper lane widths are striped to prevent edge deterioration.

Ensure that Customer Service, the PIO, Traffic, etc. are notified when the work plans are built, 14 calendar days prior to the start of the job and after completion of the job.

Ensure that the chip seal is entered into CARS for the duration of the job.

Construction

The pavement must be dry with no rain expected for at least 24 hours.

The pavement temperature and ambient air temperature should be **above** 60°F.

The asphalt emulsion **should be delivered** between 140°F and 185°F. The temperature should be taken at the time of delivery from the vendor's tanker. See material specifications for rejection or penalty range.

The haul trucks should stagger their wheel paths when backing to the aggregate spreader. Trucks should always avoid sharp turns on the chip seal and should limit turning around to public roads, not private driveways. The trucks also need to drive at an appropriate speed on the chip seal to minimize possible damage to vehicles. Finally, the driver should check for any aggregate leakage from the tailgate.

Self-propelled brooms should minimize down pressure that can displace embedded aggregate.

The pneumatic rollers should limit their speed to an acceptable speed that is not damaging the chip seal. An acceptable speed should not displace aggregate and includes gradual take offs, avoiding hard stops and any turns that can displace aggregate. They should also be ballasted per the manufacturer's recommendations.

When chip sealing in residential areas, try to minimize loose stone and spillages. Street sweepers are highly recommended instead of self-propelled brooms in these areas to avoid throwing aggregate into yards, sidewalks and roadside landscaping.

Traffic should not be allowed on the chip seal until after the final rolling and after the asphalt emulsion has set and sufficiently cured. This is typically 45 minutes to 2 hours which is heavily dependent on the weather conditions.

Average Daily Production	10 LNM – Lane Miles	EFFECTIVE DATE	October 1, 2015

ACTIVITY	Mainline Fog Seal	CODE	2051
----------	--------------------------	------	-------------

Work Method

1. Prior to the start of the job, place all necessary signs and traffic control devices for any closures and detours. Coordinate the chip seal schedule from beginning to end with Traffic.
2. Place all necessary signs and traffic control devices for road construction.
3. Close the road/lane to traffic. If the fog seal will be constructed under traffic, the use of a pilot vehicle to control traffic speeds is encouraged.
4. Sweep the roadway surface of any loose debris in front of the distributors.
5. Cover all pop-up reflectors, rpms, castings and detector housings with sand or temporary tape.
6. Spray heated ($\approx 150^{\circ}\text{F}$) asphalt emulsion (i.e. AE-F) at a maximum speed of 5 mph. Apply even coverage while avoiding excessive stops as much as possible, to prevent excessive application. Ensure that the nozzles are orientated at the same angle to achieve even application. The emulsion application rate typically ranges from 0.10 gal/yd² to 0.15 gal/yd². The emulsion should be applied uniformly at a rate ± 0.02 gal/yd² of the target application rate.

7. Use sand to avoid tracking when the application coincides with pedestrian cross-walks, driveways or other areas where traffic needs to cross prior to proper curing of the asphalt emulsion.
8. Allow the asphalt emulsion sufficient time to cure before permitting traffic to drive on it. The curing time will depend on environmental factors, such as sunlight and the humidity. However, traffic can typically be released within 30 minutes of application.
9. After completion of the chip seal, all rpms should be uncovered and cleaned.
10. Coordinate with Traffic to schedule the painting of the final markings.
11. After the new traffic lines are painted, remove all signs and traffic control devices.

Special Considerations

Planning

The distributors should be properly calibrated at minimum at the beginning of the construction season.

Make note of the existing pavement markings including the lane width. Coordinate with Traffic to ensure proper lane widths are striped to prevent edge deterioration.

Ensure that Customer Service, the PIO, Traffic, etc. are notified when the work plans are built, 14 calendar days prior to the start of the job and after completion of the job.

Ensure that the fog seal is entered into CARS for the duration of the job.

ACTIVITY	Mainline Fog Seal	CODE	2051
-----------------	--------------------------	-------------	-------------

Special Considerations (continued)

Planning

A **minimum** of 2 days should elapse from the end of the chip seal to the start of the fog seal to allow for proper initially curing of the asphalt emulsion.

If fog sealing shoulders, ensure that no weeds are present in the cracks. If weeds are present, spray with herbicide approximately 30 days prior to the start of the fog seal. This activity should be reported to either Activity 2230 – Herbicide Spot Treatment, Sub-Activity 32 Crack Spraying or Activity 2231 – Herbicide Broadcast Treatment, Sub-Activity 32 Crack Spraying, whichever is appropriate. It is also preferred to sweep the shoulder prior to the fog seal to remove any excess buildup that could possibly slow the operation.

Construction

The pavement must be dry with no rain expected for at least 24 hours.

The pavement temperature and ambient air temperature should be **above** 60°F.

The asphalt emulsion **should be delivered** between 140°F and 185°F. The temperature should be taken at the time of delivery from the vendor's tanker. See material specifications for rejection or penalty range.

The overlap application method is recommended on the centerline in both directions.

Self-propelled brooms should minimize down pressure that can displace embedded aggregate.

Streaks in the fog seal indicate either clogged nozzles or an improper overlap of spray from adjacent nozzles. Any streaking should be corrected prior to proceeding with the fog seal operation.

Traffic should not be allowed on the fog seal until after the asphalt emulsion no longer tracks. This is typically 30 minutes but is heavily dependent on the weather conditions.

The correct nozzles should be used when fog sealing. (Etnyre Part #3353788)

ACTIVITY	Mainline Crack Filling	CODE	2070
Purpose	Clean and fill cracks and joints with hot-poured sealant in asphalt pavement to reduce the infiltration of water and prevent incompressible materials from entering the crack. Crack filling is often considered a short-term treatment to help preserve the pavement between major maintenance operations or until a scheduled rehabilitation activity.	Category	Roadway/Drainage
		<input checked="" type="checkbox"/> PM <input checked="" type="checkbox"/> QA <input checked="" type="checkbox"/> Unit Cost <input checked="" type="checkbox"/> Plan Location	
Scheduling & Coordination			
Perform on the mainline in areas where cracks are beginning to develop or in areas scheduled for a seal coat surface treatment to prevent the infiltration of water and incompressibles. Cracks with low to moderate (less than 50% of crack length) edge deterioration should be filled. Cracks greater than 1 ½ inches should be considered for another treatment. Work should be scheduled during the non-winter months (March-November) due to temperature constraints with the material. Coordinate with District Traffic when pavement markings will be covered.			
Reporting		Reporting Units	Lane Miles
<p>Accomplishment shall be reported in LNM - Lane Miles.</p> <p>Each road should be completed on one work order with multiple day cards.</p> <p>Crack filling on shoulders < 4 feet wide should be reported to this activity and performed in conjunction with mainline; crack filling on shoulders > 4 feet wide should be reported to Activity 2071 and performed separately.</p> <p>Single, transverse cracks over composite pavement should be routed, sealed and reported to Activity 2090.</p> <p>All work, including taping of pavement markings, should be reported to 2070.</p>

ACTIVITY	Mainline Crack Filling	CODE	2070
----------	------------------------	------	------

Work Method

1. Place signs and safety devices.
2. Use an air compressor (or hot air lance) to thoroughly clean the crack. The cracks should be free of debris and moisture to a depth of at least twice to width of the crack. **Prior to applying the hot poured joint sealant, all cracks should be clean and dry with ambient and pavement temperatures $\geq 40^{\circ}\text{F}$.** This procedure is critical to avoid a loss of adhesion between the sealant and cracks.

Composite Pavement

3. Cracks should be filled with sealant from the bottom to avoid trapped air bubbles which will weaken the seal.
4. Squeegee the sealant into the cracks and surface voids. Avoid using excess material and **limit overbanding to < 5 inches**. If material tracking is a concern, lightly spray the sealant with soapy water or an anti-tracking solution to act as a bond breaker between the sealant and vehicle tires.

Overband Width

5. Remove all signs and safety devices.

ACTIVITY	Mainline Crack Filling	CODE	2070
-----------------	-------------------------------	-------------	-------------

Special Considerations

Cracks should be filled unless the crack is a single, transverse crack on composite pavement, which is an asphalt surface over a concrete base. Longitudinal joints should be filled unless routing is needed. If routing is needed, then the work should be reported to Activity 2090 – Mainline Crack Route and Seal or Activity 2091 – Shoulder Crack Route and Seal. Step #2 of the work method should clarify what types of cracks need to be filled versus routed and sealed.

All cracks should be filled with hot poured sealant. However, if a road is scheduled to be chip sealed in either the current fiscal year or the next fiscal year, only the cracks $\geq \frac{1}{4}$ " should be filled.

If pavement markings will be affected from the crack filling, cover them with temporary tape to protect them during application and remove the temporary tape after the road has been filled. If covering the pavement markings with hot poured sealant can't be avoided (crack is through the pavement marking), coordinate with District Traffic to paint the traffic markings after the crack filling operation is complete.

The pavement must be dry and all joints should be free of moisture.

The pavement and air temperature should be at least 40°F. **Sealant should never be applied when the temperature is below freezing.**

Sealant should never be heated for more than 12 hours. Segregation will occur if the material is overheated. **Continuously adding blocks as they are used will eliminate to possibility of segregation.** Plan accordingly based on the workload when adding blocks of sealant to the melter. **When placing blocks of sealant in the melter, the exterior of the blocks should be free of debris, which can damage the pump or plug the wand.**

Periodically check for joint cleanliness and moisture. If the joint is not clean, blow compressed air in the joint again. If the joints have moisture present, use hot air blasting to adequately dry them. If hot air blasting is not available, suspend the operation for a later date when the pavement conditions are acceptable.

Straight squeegees should not be used due to wide overbanding issues. Only "U" shaped and "V" shaped squeegees should be used.

Attachments are available for the hot poured sealant melters, such as the Crafcro Brand "Super Shot Drip Stopper", which can be used to eliminate excess sealant from leaving the applicator wand once the trigger is released. The Crafcro Brand "Swivel Adapter" can be used to eliminate the use of a squeegee on the operation.

Cracks should be cleaned using an air compressor using no less than 70 cfm at 100 psi. **Leaf blowers are not permitted.**

Hot air lance usage is optional. A hot air lance will improve the adhesion of the sealant material. However, extra attention should be given to ensure the pavement does not get damaged from the hot air lance. Prior to any usage of a hot air lance, ensure there is adequate training for all operators.

Sealant temperature is critical to a successful job. Sealant should be stored, handled and heated to the manufacturer's specifications. The application temperature should be between 350°F and 400°F with the recommended temperature between **370°F and 390°F**. The maximum temperature should **never exceed 400°F**. The heat transfer oil should be 500°F to properly melt the sealant but should never exceed 525°F.

The hot poured joint sealant melter/applicator should be kept at least $\frac{1}{3}$ full at all times to help maintain temperature uniformity. The hot poured joint sealant should be continuously agitated except when new material is being added.

At the end of the day, the applicator wand should be cleaned and cleared of any residual material.

Sub Activities				
Work Method				
<ol style="list-style-type: none"> Place signs and safety devices. Using a pavement router, route all single, transverse cracks over composite pavement, which is an asphalt surface over a concrete base. The reservoir should be square with dimensions of $\frac{3}{4}$" x $\frac{3}{4}$". If the single, transverse crack is only partially across the shoulder, continue routing across the entire shoulder width. 				
				
Before Routing		After Routing		

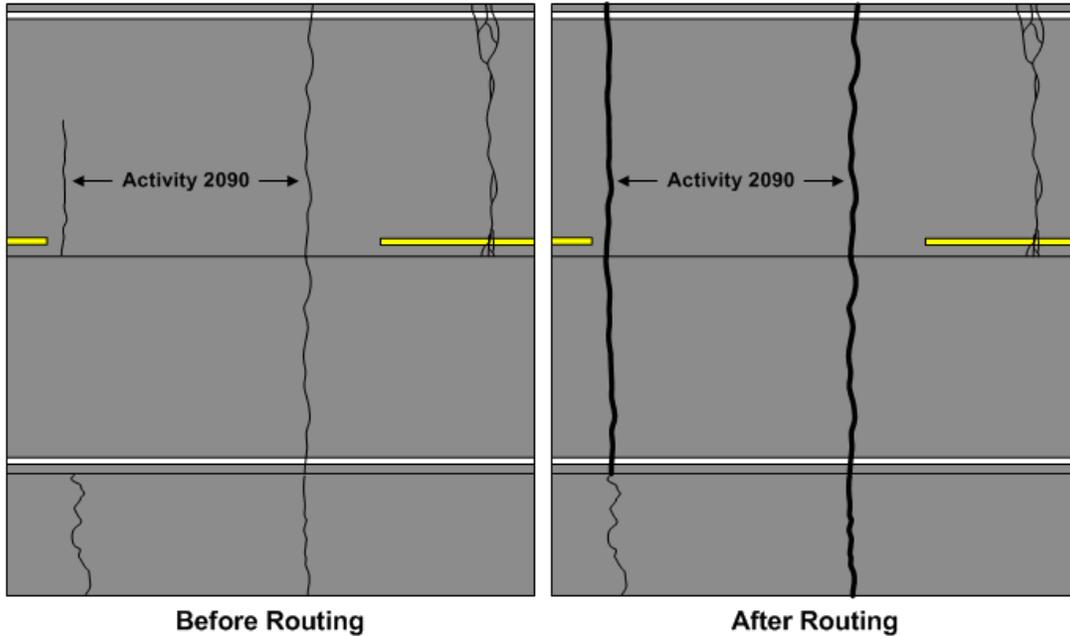

ACTIVITY

Shoulder Crack Route and Seal

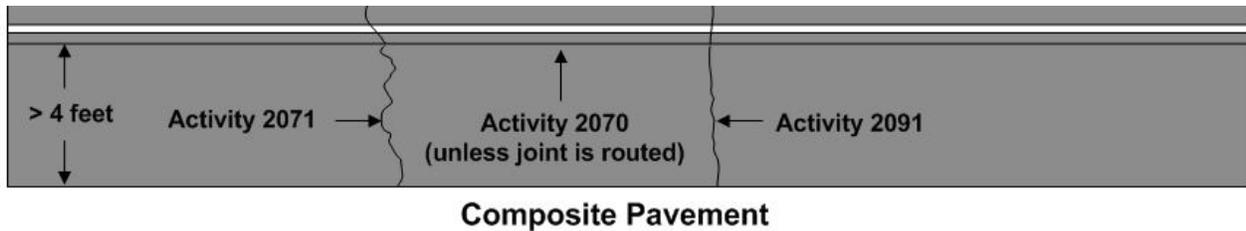

CODE

2091

Work Method (continued)

- Use an air compressor (or hot air lance) to thoroughly clean the crack. The cracks should be free of debris and moisture to a depth of at least twice to width of the crack. **Prior to applying the hot poured joint sealant, all cracks should be clean and dry with an ambient and pavement temperatures $\geq 40^{\circ}\text{F}$.** This procedure is critical to avoid a loss of adhesion between the sealant and cracks.

- Cracks should be filled with sealant from the bottom to avoid trapped air bubbles which will weaken the seal.
- Squeegee the sealant into the cracks and surface voids. Avoid using excess material and **limit overbanding to < 5 inches**. If material tracking is a concern, lightly spray the sealant with soapy water or an anti-tracking solution to act as a bond breaker between the sealant and vehicle tires.

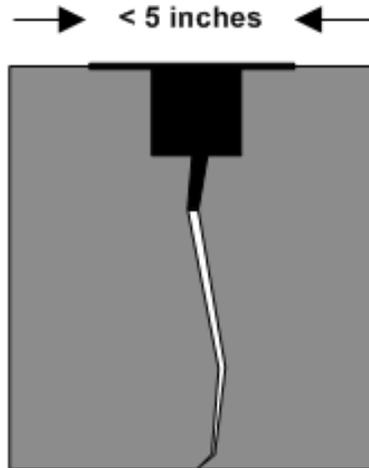

ACTIVITY

Shoulder Crack Route and Seal

CODE

2091

Work Method (continued)

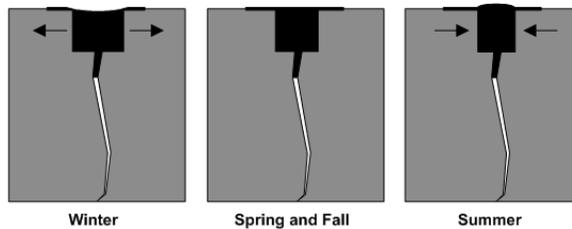

- 6. Remove all signs and safety devices.

Special Considerations

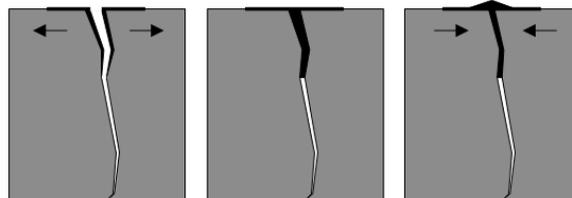

Only single, transverse cracks on composite pavement, which is an asphalt surface over a concrete base, should be reported to Activity 2091. Longitudinal joints should be reported only if routing is needed. Step #3 of the work method should clarify what types of cracks need to be filled versus routed and sealed.

Seasonal Effects on Routed Transverse Cracks

Winter Spring and Fall Summer

Seasonal Effects on Non-Routed Transverse Cracks

Winter Spring and Fall Summer

ACTIVITY	Shoulder Crack Route and Seal	CODE	2091
----------	--------------------------------------	------	-------------

Special Considerations (continued)

If pavement markings will be affected by the crack route and seal, cover them with temporary tape to protect them during application and remove the temporary tape after the road has been sealed. If covering the pavement markings with hot poured sealant can't be avoided (crack is through the pavement marking), coordinate with District Traffic to paint the traffic markings after the crack filling operation is complete.

The pavement must be dry and all joints should be free of moisture.

The pavement and air temperature should be at least 40°F. **Sealant should never be applied when the temperature is below freezing.**

Cracks should be sealed the same day they are routed. **However, no more than 3 calendar days should pass before the cracks are sealed.**

Routed cracks should be periodically checked for routed dimension. Routed cracks should have square sides with a flat bottom. If the routed crack is not square but rounded, the carbide cutters should be replaced. Typically, carbide cutters should last for 17,000 to 24,000 LF (linear feet), which will vary depending on the pavement type.

Sealant should never be heated for more than 12 hours. Segregation will occur if the material is overheated. **Continuously adding blocks as they are used will eliminate to possibility of segregation.** Plan accordingly based on the workload when adding blocks of sealant to the melter. **When placing blocks of sealant in the melter, the exterior of the blocks should be free of debris, which can damage the pump or plug the wand.**

Periodically check for joint cleanliness and moisture. If the joint is not clean, blow compressed air in the joint again. If the joints have moisture present, use hot air blasting to adequately dry them. If hot air blasting is not available, suspend the operation for a later date when the pavement conditions are acceptable.

Straight squeegees should not be used due to wide overbanding issues. Only "U" shaped and "V" shaped squeegees should be used.

Attachments are available for the hot poured sealant melters, such as the Crafcoc Brand "Super Shot Drip Stopper", which can be used to eliminate excess sealant from leaving the applicator wand once the trigger is released. The Crafcoc Brand "Swivel Adapter" can be used to eliminate the use of a squeegee on the operation.

Cracks should be cleaned using an air compressor using no less than 70 cfm at 100 psi. **Leaf blowers are not permitted.**

Hot air lance usage is optional. A hot air lance will improve the adhesion of the sealant material. However, extra attention should be given to ensure the pavement does not get damaged from the hot air lance. Prior to any usage of a hot air lance, ensure there is adequate training for all operators.

Sealant temperature is critical to a successful job. Sealant should be stored, handled and heated to the manufacturer's specifications. The application temperature should be between 350°F and 400°F with the recommended temperature between **370°F and 390°F**. The maximum temperature should **never exceed 400°F**. The heat transfer oil should be 500°F to properly melt the sealant but should never exceed 525°F.

The hot poured joint sealant melter/applicator should be kept at least 1/3 full at all times to help maintain temperature uniformity. The hot poured joint sealant should be continuously agitated except when new material is being added.

At the end of the day, the applicator wand should be cleaned and cleared of any residual material.

ACTIVITY

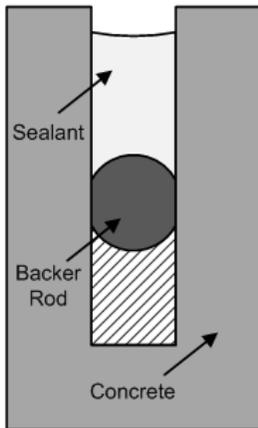

Resealing Concrete Pavement Joints

CODE

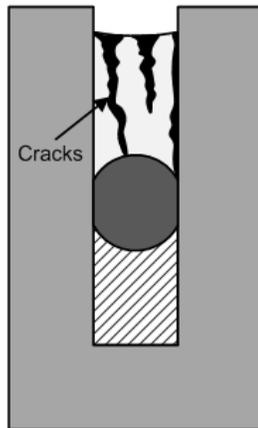

2095

Work Method

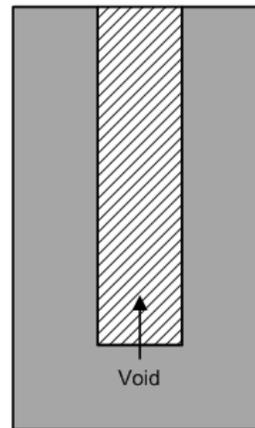

1. Place signs and safety devices.
2. Remove the old sealant and backer rod from the joint.
3. Clean the joint with high pressure air from an air compressor or hot air blasting using a hot air lance. Do **NOT** use a leaf blower to clean out the joints. All loose dirt and debris should be blown off the edge of the roadway away from traffic.
4. Fill the joint using a specialized tip with hot poured joint sealant from the bottom up to avoid any voids due to air bubbles. Fill with sealant to within $\frac{1}{4}$ " of the surface. **DO NOT OVERFILL.**

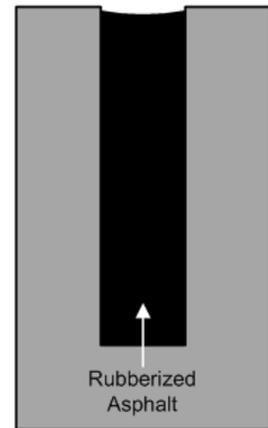

Joint Filled with Sealant

Failed Joint Filled with Sealant

Clean Joint Prior to Resealing

Joint Resealed with Rubberized Asphalt

Elevation View

5. Spray a water/detergent mixture or anti-tracking solution with a handheld sprayer to minimize tracking of the sealant. Allow sufficient time, typically 15 to 30 minutes, for the sealant to cure before opening to traffic.
6. Remove all signs and safety devices.

Special Considerations

The pavement must be dry and all joints should be free of moisture.

The pavement and air temperature should be at least 40°F and the pavement temperature should not exceed 135°F.

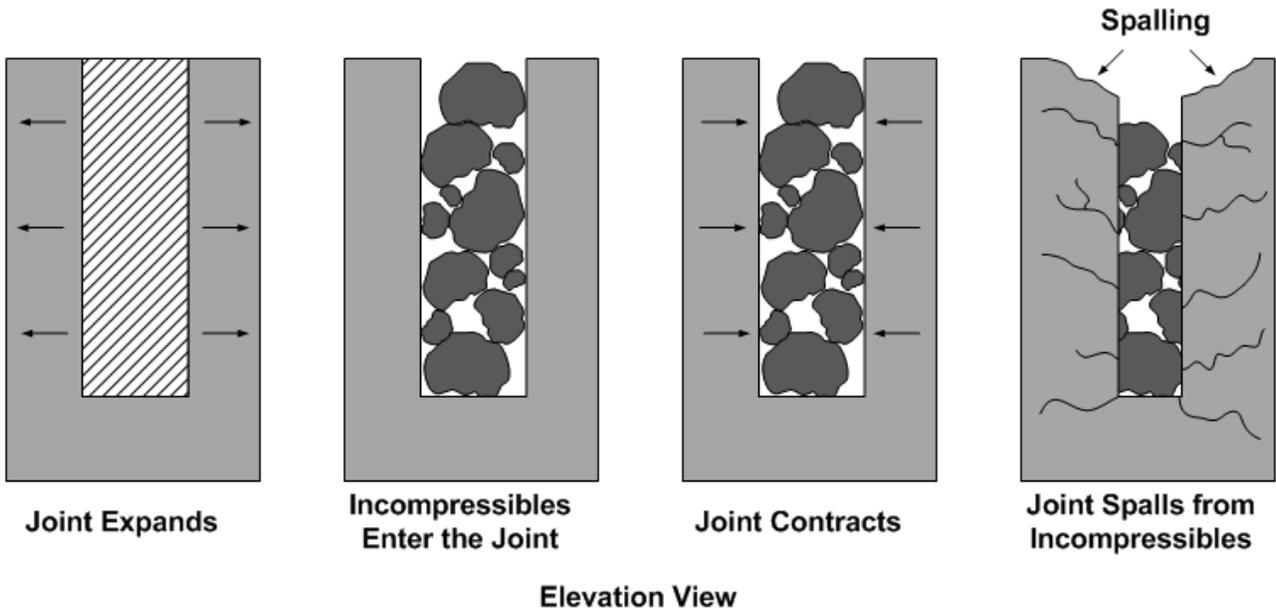

The joint cleaning operation should take place immediately in front of the joint resealing operation to maintain the cleanliness of the joints. If joints are not sealed on the same day the old sealant and backer rod are removed, then the joints should be cleaned again when the operation continues. All joints should be sealed **within 3 days** after the original sealant and backer rod being removed.

Periodically check for joint cleanliness and moisture. If the joint is not clean, blow compressed air in the joint again. If the joints have moisture present, use hot air blasting to adequately dry them. If hot air blasting is not available, suspend the operation for a later date when the pavement conditions are acceptable.

WORK PERFORMANCE STANDARD

ACTIVITY		Spot Repair of Unpaved Shoulders	CODE	2100
Purpose		Category Roadway/Drainage <input type="checkbox"/> PM <input type="checkbox"/> QA <input type="checkbox"/> Unit Cost <input type="checkbox"/> Plan Location		
Repair small areas of shoulders no larger than one mile, by adding aggregate, reshaping and compacting to correct edge ruts, potholes, and corrugations, and to replace lost material at washouts, around mailboxes, and public road approaches. Note: This activity is used for reporting work on any aggregate areas adjacent to a paved shoulder.				
Scheduling & Coordination				
Schedule this work throughout the year at locations where hazardous conditions have developed, due to rutting and at places where traffic goes onto the shoulder often. Repair localized edge ruts after they have become 2" deep. Recurring areas should be reported to the District and considered for more permanent repairs.				
Reporting		Reporting Units Short Tons		
Accomplishment shall be reported in Tons of aggregate STN (Short Ton) Minor improvement projects should be reported to Activity 2991. Activity 2991 is used for constructing shoulders where none currently exist. Repairs to paved shoulders should be reported to Activity 2010 (Shallow Patching) or Activity 2020 (Deep Patching), as appropriate. If Activity 2100 Spot Repair of Unpaved Shoulders and Activity 2110 Blading shoulders(which is a continuous operation) are performed at same time, the work should be separated onto two work orders. Any repairs greater than one mile in length should be reported to Activity 2130 (Recondition Shoulders)

Average Daily Production	40- 55 Swath Miles	EFFECTIVE DATE	4/1/2015

ACTIVITY	Mowing	CODE	2210
-----------------	---------------	-------------	-------------

Work Method			
<ol style="list-style-type: none"> 1. Place safety devices. 2. Check safety equipment on tractor, fill equipment with fuel while engine is cool and not running. 3. Check safety equipment mower, all guards in place and working properly. 4. Check and adjust mower height to the correct mowing height to between 6 to 8 inches. This is the most important work method the operator has control over, if mowed less than 6 inches the grass root system is damaged allowing weeds to fill in areas covered by grass. When mower scalps or digs into ground the area is prone to invasive species to fill in the area. Proper mowing height will also extend the life of all equipment used to mow and cost to maintain. 5. Lubricate all grease zerk fittings daily or as recommended by manufacturer. 6. Start all mowing next to the shoulder and work your way out to the designated mowing limit. To be most efficient match the mower width to the area to be mowed, if mowing limited width on a wide R/W, one Batwing Mower should be used. On roads with narrow R/W's that only requires one pass, use a five or six foot mower to complete the limited width. Mower may mow either with or against traffic or any combination. When mowing with tractors on both sides of the road mowers must be separate by a minimum 500 feet. Tractors must not have any part of mowing equipment on the travel portion of the roadway. 7. Overlap each pass by 10% -15% to pick up any vegetation missed on first pass. 8. Stop tractor/mower and remove any debris/trash that may be thrown from mower, damage equipment or look unsightly after being cut. 9. Care should always be taken when mowing close to fixed object(signs, guardrail and other safety devises) not to damage or hit them. 10. Trimmers should cut broadleaf plants and the seed heads off of grass species around signs and guardrail. Trimmer will also need to load debris/trash that mowers moved to side in trim vehicle for disposal. 11. Clean equipment by sweeping with kitchen broom within the mowed area immediately after cutting any invasive or noxious plants. This will reduce the spread and cost to control these species. 12. Park equipment in a secure location that is out of the clear zone and that will discourage vandalism. Always get permission to park on private property and never re-fuel equipment on private property. 13. Remove safety devices 			

Special Considerations			
Mowing less than six inches will reduce the overall score of Machine Mowing Quality Assurance Evaluation by 30 points.

INDIANA DEPARTMENT OF TRANSPORTATION
DIVISION OF MAINTENANCE
CHAINSAW SAFETY INSTRUCTIONS
ACTIVITIES 2220, 2221, 2250, 2251, 2260, 2280

This is the general instructions for the use of a chainsaw for all activities. Each activity is required to use a chainsaw and work methods vary only slightly but all can be dangerous if precautions are not followed.

GENERAL:

Only personnel trained in Basic Chain Saw Safety shall operate a chain saw and only qualified personnel qualified personnel shall perform brush cutting, tree trimming and tree removal operations.

There are many hazards associated with operating a chain saw and the types of injuries that could occur require that it never be a one person operation.

1. Personal Protective Equipment

An OSHA approved Logger First Aid Kit shall be present and available at all times.

Following Personal Protection Equipment shall be worn by the Chain Saw Operator

- Hardhat
- Chain Saw Chaps
- Eye Protection
- Face Protection
- Hearing Protection
- Protective Foot Wear
- Hand Protection - Should have slip resistant palm
- Assistant (Safety Observer)
- Hardhat
- Eye Protection
- Hearing Protection
- Protective Foot Wear
- Hand Protection - Should have slip resistant palm

In addition to above PPE, the Assistant (Safety Observer) shall have a whistle for warning others. If worn around neck, it must be tucked inside clothing to prevent becoming a hazard. Whistle shall be readily accessible but shall not be worn in a manner to become a personal safety hazard. Do not allow whistle to hang freely and become a "snag" hazard.

2. Communications:

Crew shall have properly operating employer provided communication equipment capable of maintaining continuous communications with the local Sub District Office and develop backup procedures in the event of loss of communications.

3. Emergency Plan:

Sub District:

- Shall know the location of the work site
- Provide routing directions to local emergency authorities.
- Notify crew of all Weather Warnings for their area

Work Crew:

- Provide local Sub District with current work site location or relocation.
- Provide the Sub District with emergency routing directions. (Example: For a work site that is located in a remote location off the roadway.)
- If needed, when working off the roadway, identify emergency route by marking with cones, flags or other identifiable means.

- Be alert of changing weather conditions and request updates from the sub district as necessary. (All work shall cease and employees shall move to a safe place during electrical storms, periods of high winds or other weather conditions that may be dangerous to personnel.)

4. Work Site Hazards

There are many hazards associated with operating a chain saw and the types of injuries that could occur require that it never be a one person operation. All Chain Saw Operations, at a minimal, shall consist of a Chain Saw Operator and an Assistant (Safety Observer)

A work site hazard assessment shall be conducted prior to all operations and hazards identified.

A. Hazard Identification:

All hazards and obstruction shall be identified and addressed prior to commencement of work.

Areas that may be of concern but not limited to are:

- Fences – to include Property Lines
- All utilities – such as pipe line markers, valve stations, overhead lines, etc.
- All buildings and structures
- Side walks, Bike Paths, Roadways. Etc.
- Vehicles
- Pedestrian traffic
- Other trees or brush

5. Tree Felling

Proper tree felling procedures shall be developed and only personnel trained and qualified in tree felling shall perform this type of operation.

Types of Hazards:

Every tree is unique and must be approached with extreme caution. Trees shall be identified and a hazard assessment shall be conducted prior to all cutting operations.

Some of these hazards are:

- Dead Limbs and tops
- Excessive lean
- Fungus
- Rot and cavities
- Loose bark (could indicate hidden tree rot)
- Conks (signs of physical distress)

A. Planning and Assessment:

- Determine the lean of the tree
- Direction for the fall of tree.
- Clear an area around the tree before starting to cut.
- Fell with lean of tree whenever possible

B. Preparation:

Always ensure a “clear area” is established prior to cutting operations.

- Cut/remove all dead snags or stubs first,
- Prepare two escape routes 45-degrees away from the direction of fall.
- Be sure your escape routes are not obstructed with underbrush or objects.

- Before starting to cut, make sure no one is closer than two tree lengths away from felling operations.
- C. Cutting:
- Make a notch on all trees no matter how small the diameter.
 - Prevent “kick back” by leaving sufficient wood between the notch and the “back cut” to allow a hinge. (Never cut a standing tree completely through)
 - Give a timely yell understood by all employees, just before the “back cut”.
 - Retreat by using “escape routes” to a safe distance of at least 20 feet from tree. If possible, stand behind another tree at the end of your retreat path.
6. Chain Saw Operations Using A Bucket Truck (Aerial Lift Equipment)
- All Bucket Truck operations shall be conducted by a qualified operator and shall follow all safety rules associated with chain saw and aerial lift equipment. Operations in or alongside roadways shall adhere to the Work Zone Safety Manual. All personnel associated with this type of operation shall wear Hard Hats at all times when outside of a vehicle.
- A. Danger Zone:
- That area around the Bucket Truck and the cutting zone where there is operating equipment and or falling limbs or other debris.
 - Danger Area: The supervisor shall evaluate the area around the cutting zone and equipment and establish a Danger Zone. No one shall be allowed in this area without the Safety Observers permission.
- B. Safety Observer:
- A person designated by the supervisor to observe all ground activity and coordinate with the Bucket Operator entry of workers into the Danger Zone. At no time will personnel be allowed in the Danger Zone with out the permission of the Safety Observer. The Safety Observer shall have permission from the Bucket Operator before allowing personnel entry to the Danger Zone. No one is allowed inside the Danger Zone while equipment or chain saw is in operation.
- C. Bucket Truck (Aerial Lift Equipment) Operator
- The operator shall be qualified to operator all associated equipment and shall maintain visual and or oral communications with the Safety Observer to ensure no unauthorized entries within the Danger Zone. No one is allowed inside the Danger Zone while equipment or chain saw is in operation.
 - A two person operation where there is a chain saw operator and an aerial lift operator occupying the same platform, both persons must wear all PPE required for operating a chain saw.
- D. Other Equipment
- All other vehicles, trailers, chippers, etc. shall not be parked inside the Danger Area.
7. Warning Signals & Briefings
- A. Emergency or Danger Warning Signal:
- The Assistant (Safety Observer) shall use a whistle to sound a warning and all work shall cease immediately and an assessment shall be performed before work recommences. Whistle shall be readily accessible but shall not be worn in a manner to become a personal safety hazard. Do not allow whistle to hang freely and become a “snag” hazard.
- B. Emergency or Danger Warning Signal:
- The Assistant (Safety Observer) shall use a whistle to sound a warning and all work shall cease immediately and an assessment shall be performed before work recommences.

C. Daily Safety Brief:

- It is vital that a Daily Safety Brief is conducted and all parties understand their assigned jobs/duties, special warning signals and their emergency actions. The supervisor will ensure the Operator and Assistant (Safety Observer) have discussed and clearly understand all communication signals.

WORK PERFORMANCE STANDARD

ACTIVITY	Manual Brush Cutting	CODE	2220
Purpose	<p>This activity is used where mechanical brush cutting is not feasible or assessable, examples are under & around bridges and communities that are sensitive to other methods of brush cutting.</p> <p>The benefit of this activity are as follows:</p> <ul style="list-style-type: none"> • Allows access to the bridge inspection equipment and personnel. • Save environmental mitigation when rehabilitation work is needed on bridges. • Prevents damage to bridge structures from falling trees. • Prevents customer complaints when near sensitive areas. • Provides quick response to isolated complaints. 		<p>Category</p> <p><input type="checkbox"/> PM</p> <p><input type="checkbox"/> QA</p> <p><input type="checkbox"/> Unit Cost</p> <p><input type="checkbox"/> Plan Location</p> <p>Right-of-Way</p>
Scheduling & Coordination			
<p>Brush cutting should be scheduled anytime temperatures are below 60 degrees. Brush is defined to be any tree or shrub species less than 3 inches in diameter at a height of 4 ½ feet from the ground. This is called "Diameter at Breast Height (DBH)". Any tree above the 3" at DBH must not be cut down between April 1st to October 1st, due to the federally protected Indiana Brown Bat However trimming of limbs of any size may occur at any time. If you see any bat in any tree stop all work and Central Office Environmental Office must be contacted.</p> <p>Removal of downed limbs or other storm debris should be reported to Activity 2611, Storm Debris Removal.</p> <p>Work needs to be coordinated with bridge deficiencies.</p>			
Reporting	Reporting Units		Square Feet
<p>Accomplishment is the number of square feet cleared. When cutting brush at bridge locations, report to the bridge asset and not road section. Measure the length times the width (in feet) to determine the area cleared for reporting purposes. Detail drawings below.</p>

Average Daily Production	10,000 - 15,000 Sq.Ft	EFFECTIVE DATE	July 1, 2016

ACTIVITY	Manual Brush Cutting	CODE	2220
Work Method			
<p>Manual cutting using chainsaw.</p> <ol style="list-style-type: none"> 1. Place all Safety Devices 2. Put on all of your proper safety equipment, as injury and death may occur from chainsaw operation. Tie back long hair and remove any jewelry from your body. 3. Set the chainsaw on a flat area. Place your left hand on the front handle and your right foot inside the rear handle. Grab the starter rope with your right hand and start the chainsaw according to your model's starting instructions. 4. Walk up to the first bush to be cut. Depress the throttle completely and move the tip across the branches of the bush. Work from the top down and cut slowly to the desired depth. 5. Cut as much as possible with the tip and the underside of the bar, where most of the power comes from, giving it a cleaner cut. Move the tip slowly and always keep an eye on the tip. Keep all people at least 10 yards away at all times. All stumps shall be cut to a level not to extend over 2 inches from being flush to the ground. 6. Turn the chainsaw off if any pieces of the bush become trapped between the chain and the bar. Lock the safety brake when you're walking with the chainsaw. Keep both hands on the chainsaw at all times when it is running. 7. If under a bridge, debris should be stacked on the edge of R/W, never stack under bridge deck or where high water will carry downstream. If on roadside the debris should be processed through a brush chipper and disbursed on R/W or deposited in truck and dumped at an approved location. 8. Apply an approved Cut Stump Treatment to all stumps within 1 hour after cutting. 9. Remove all Safety Devices. 			
Average Daily Production	10,000 - 15,000 Sq. Ft	EFFECTIVE DATE	July 1, 2016

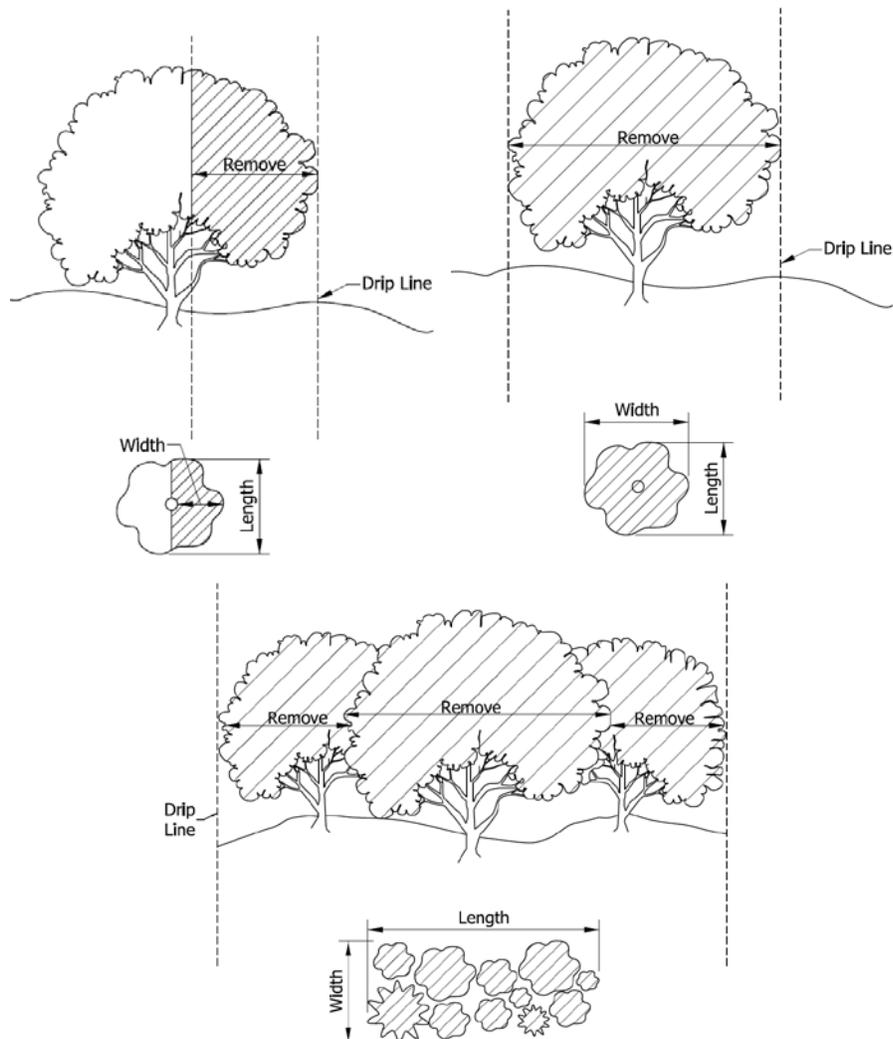

ACTIVITY

Manual Brush Cutting (Continued)

CODE

2220

Work Method Continued

Notes:

1. When drip line/limbs are touching, the area to be measured is from the outer limits of the end bushes.
2. When isolated brush is removed, instead of calculating the area as a circle, square the area off.
3. Square Footage = Length x Width
4. This activity is for brush cutting. Brush is woody vegetation that is 3 inches or less in diameter at breast height.
5. Woody vegetation that is over 3 inches diameter at breast height is considered a tree, and should be reported to Activity 2250 Tree Trimming or Activity 2251 Tree Removal.

Special Considerations

WORK PERFORMANCE STANDARD

ACTIVITY	Mechanical Brush Cutting		CODE	2221
Purpose			Category	Right-of-Way
Remove any brush that is blocking the safe sight. The benefits of this activity are as follows: <ul style="list-style-type: none"> Reduces asphalt deterioration caused by trapped moisture Provides shoulder space for the motoring public in emergencies Reduces damages to vehicles from low hanging limbs Increases the distance a motorist can see vehicles, children and animals along the sides of the roadway Removes vegetation that may obstruct traffic signs Eliminates invasive woody species. 			<input type="checkbox"/> PM <input type="checkbox"/> QA <input type="checkbox"/> Unit Cost <input type="checkbox"/> Plan Location	
Scheduling & Coordination				
<p>This work will be scheduled in the fall and winter months after leaves have fallen to avoid disturbing tree nesting birds and the hazard of cutting into a hornets' nest. Brush is defined to be any tree or shrub species less than 3 inches in diameter at a height of 4 ½ feet from the ground. This is called "Diameter at Breast Height (DBH)". Any tree above the 3" at DBH will not be considered "Brush Cutting".</p> <p>Special consideration should be given to the location of this type of clearing if in a sensitive area. If controlling an invasive species this would be a reason for this work to take place at a sensitive site. District personnel should coordinate with Public Information officers of their plans and reasoning.</p> <p>If work is being performed to cut back native trees (side trim). The branches cut should be smaller than one (1) inch so not to harm the health of tree. Limbs/branches larger than one (1) inch should have a finish cut using a chainsaw to make a uniform flat cut at the growth ring of the tree after using other mechanical methods.</p>				
Reporting			Reporting Units	Square Feet
Accomplishment is the number of square feet cleared. Measure the length times the width (in feet) to determine the area cleared for reporting purposes. See drawings below.

Average Daily Production	43,560 – 130,680 Sq. Ft		EFFECTIVE DATE	April 1, 2015

ACTIVITY

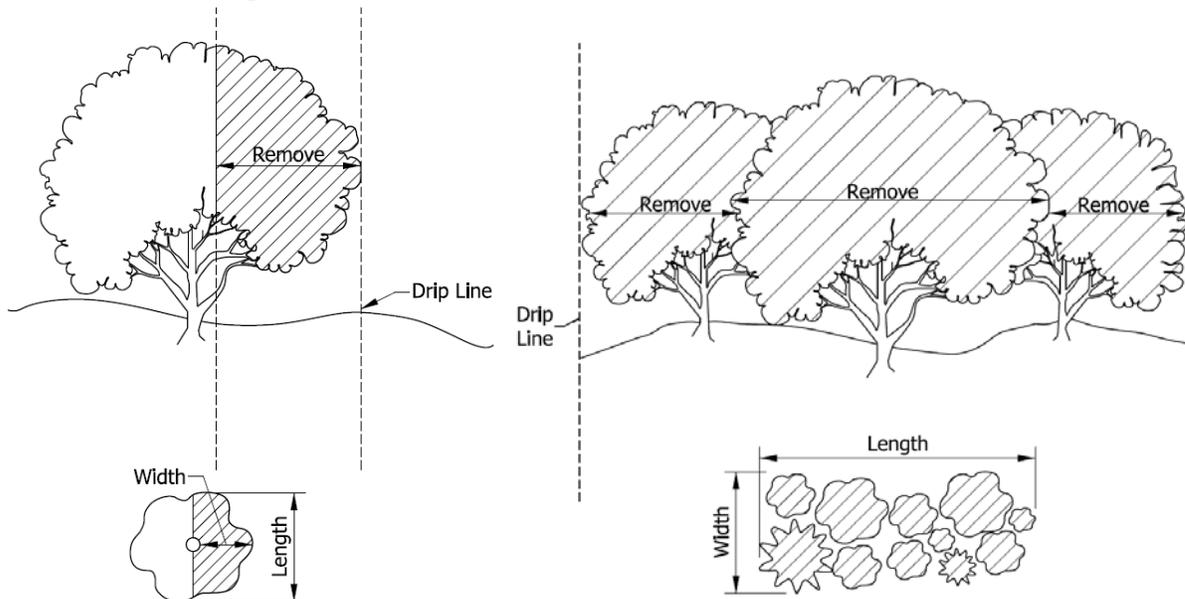

Mechanical Brush Cutting

CODE

2221

Work Method

1. Place Safety Devices
2. Begin on the outside of the brush being cut, making small swath no more than twelve (12) inches. This will help reduce the likelihood of throwing large debris outside work area.
3. After the first pass, make second pass to limb/debris on ground. This will make the debris smaller and eliminate the need to pick up.
4. Repeat step 2 and step 3. Continue to make swath on brush until goal is met or the limb/tree is too large for machine. The maximum diameter limb/log that can be cut with Boom mower is 3 inches. Inexperienced operators often try to cut heavier wood, damaging the mower.
5. If side trimming native tree, use chainsaw to make uniform flat cuts to affected limbs. When cutting invasive species, apply an approved herbicide to the cut to prevent the re-growth. No finish cuts should be made to invasive plants. This may only be completed while working machine if the cutting operation is a minimum of 500 feet from crew doing finish work.

Notes:

1. When drip line/limbs are touching, the area to be measured is from the outer limits of the end bushes.
2. When isolated brush is removed, instead of calculating the area as a circle, square the area off.
3. Square Footage = Length x Width
4. This activity is for brush cutting. Brush is woody vegetation that is 3 inches or less in diameter at breast height.
5. Woody vegetation that is over 3 inches diameter at breast height is considered a tree, and should be reported to Activity 2250 Tree Trimming or Activity 2251 Tree Removal.

Work Method			
<ol style="list-style-type: none"> 1. Place signs and safety devices. 2. Read label of chemical. Handle, mix and apply only as label specifies for the intended use. If label is not specific about a certain area, contact the District management. 3. All herbicide must be applied by a licensed applicator. 4. Read and follow safety and legal requirements listed below. 5. Avoid mixing/loading on gravel driveways or other surfaces that allow spills to sink quickly through the soil. Install an anti-backflow device on the well or hydrants to prevent reverse flow of liquids into the water supply. Never put the hose in the sprayer tank. Provide an air gap of 6 inches between the hose and the top of the sprayer tank. 6. Mix chemical. Spray mixture must be mixed correctly and in the correct order <ul style="list-style-type: none"> • Water, fill the tank ¼ to ½ with carrier and begin agitation • Add water conditioners (for example, pH adjusters, ammonium sulphate) • Add granules / flowables / powders herbicides and mix well. • Add water soluble herbicides • Add stickers , spreaders , surfactants. • Add Drift retardant. • Water, fill the tank, continue agitation 7. Drift Control must be used at label rates for every tank. 8. Apply mix to designated areas using methods as instructed. If weather or wind changes and causes the potential for drift, then change locations or cease work and notify supervisor. 9. Remove signs and safety devices. 10. Clean and maintain clothing and protective equipment. DO NOT CARRY CHEMICALS HOME. 11. Know and follow spill containment procedures if a spill occurs. 			

Special Considerations			
<p>Document information necessary to comply with current pesticide laws(i.e. labels of all chemicals in tank + MSDS sheets). Place a complete description of the chemical and mixing instructions in truck cab.</p> <p>A pesticide spill can happen to anyone—even to those individuals who exercise safety procedures to minimize the possibility. Your degree of emergency preparedness will have a direct impact on the severity of the situation if a spill occurs.</p> <p>PLAN AHEAD...HAVE EQUIPMENT AVAILABLE FOR THE SPILL EMERGENCY</p> <p>Be prepared. Missing, unavailable, and nonfunctional equipment is of no help in an emergency.</p> <ul style="list-style-type: none"> • Protective equipment for all products handled. • Absorbent material to contain a spill (Granular absorbent, absorbent pads and boom, as appropriate). • Tools for constructing temporary earthen dikes 			

APPROVED BY	
 <hr/> Director, Highway Maintenance	

Average Daily Production	2 - 10 Acres	EFFECTIVE DATE	7/1/2014
---------------------------------	---------------------	-----------------------	-----------------

INDIANA DEPARTMENT OF TRANSPORTATION
DIVISION OF MAINTENANCE
WORK PERFORMANCE STANDARD

ACTIVITY	Herbicide Broadcast Treatment	CODE	2231
Purpose	<p>To control undesirable vegetation and noxious weeds, applying chemicals continually to roadside vegetation and soil along shoulders maintained by State forces. The primary objectives for maintenance of roadside vegetation are to provide for safe highway operation and to comply with legal regulations for control of noxious weeds and protection of the environment.</p>	Category	Right-of-Way
		<input type="checkbox"/> PM <input type="checkbox"/> QA <input type="checkbox"/> Unit Cost <input type="checkbox"/> Plan Location	
Scheduling & Coordination			
<p>There are two seasonal times that broadcast treatments should be scheduled. The first is in late summer/fall after crops have started to mature, this is indicated by the yellowing of leaves on both corn and soybeans. The second is in the spring before crops have been planted, scheduling during these two times will reduce your chances of crop damage. The fall is the best time to control perennial weeds and brush, this is the time of the year that these plants are storing energy for the winter. Large interstate R/W's may be scheduled throughout the growing season when doing the medians and areas next to the shoulders up to 20 feet. The same guidance as above will apply when treating within 10 feet from the interstate fence line.</p> <p>Proper attention to the following three basic principles will improve the effectiveness of herbicides and decrease potential negative impacts to non-target species, the environment, and the applicator:</p> <ol style="list-style-type: none"> 1. Choose the right herbicide for the job, plant identification is critical. If you do not know the plants to control, get assistance from District Roadside Coordinator. 2. Apply the herbicide at the right time, knowing life cycles of plants is beneficial in two ways. The life cycles will tell the manager when plants are more likely to be controlled. It can also tell the manager plants that will not be harmed at certain time in the cycle. Example are biennial plants. Bull thistle and Teasel has developed seed, treatment is a waste of resources. 3. Use the proper application technique, knowing equipment capability is needed to select method best suited for project. Examples for proper technique should consider, location of target plant, equipment needs and the knowledge/skill level of applicator. Additional site characteristics such as soil type, slope, and the existing vegetation — both target and non-target plants — should also be considered when selecting the herbicide and planning the application process. <p>Always read and follow the herbicide label directions.</p>			
Reporting	Reporting Units		Acres
<p>Accomplishment is the total acres treated. Records should be accurate and contain the following data:</p> <ol style="list-style-type: none"> 1. Total area treated, in acres 2. Date and time of application. 3. Type of equipment used. 4. Herbicide(s) used. 5. Mixing information etc. 6. Rate of application. 7. Location (route number, mile post or distance from nearest intersection, distance treated). 8. Target vegetation. 9. Weather conditions at time of application (temperature, humidity, wind speed and wind direction). 10. Name of applicator and Pesticide Applicator License number. 11. Miscellaneous comments (including spray pressure, nozzle type, nozzle size, speed at which spraying and distance from spray nozzle to target). <p>Document information necessary to comply with current pesticide laws (i.e. labels of all chemicals in tank + MSDS sheets). Place a complete description of the chemical and mixing instructions in truck cab.</p>

<p>Work Method</p> <ol style="list-style-type: none"> 1. Place signs and safety devices. 2. Read label of chemical. Handle, mix and apply only as label specifies for the intended use. If label is not specific about a certain area, contact the District management. 3. All herbicide application must be applied by a licensed applicator. 4. Read and follow safety and legal requirements listed below. 5. Avoid mixing/loading on gravel driveways or other surfaces that allow spills to sink quickly through the soil. Install an anti-backflow device on the well or hydrants to prevent reverse flow of liquids into the water supply. Never put the hose in the sprayer tank. Provide an air gap of 6 inches between the hose and the top of the sprayer tank. 6. Mix chemical. Spray Mixture must be mixed correctly and in the correct order <ul style="list-style-type: none"> • Water, Fill the tank ¼ to ½ with carrier and begin agitation • Add water conditioners for example, pH adjusters, ammonium sulphate. • Add granules / flowables / powders herbicides and mix well. • Add water soluble herbicides • Add stickers , spreaders , surfactants. • Add Drift retardant. • Water, fill the tank. • Continue agitation 7. Drift Control must be used at labels rates to every tank. 8. Apply mix to designated areas using methods as instructed. If weather or wind changes and causes the potential for drift, change locations or cease work and notify supervisor. 9. Remove signs and safety devices. 10. Clean and maintain clothing and protective equipment. DO NOT CARRY CHEMICALS HOME. 11. Know and follow spill containment procedures if a spill occurs. 			
<p>Special Considerations</p> <p>Document information necessary to comply with current pesticide laws(i.e. labels of all chemicals in tank + MSDS sheets). Place a complete description of the chemical and mixing instructions in truck cab.</p> <p>A pesticide spill can happen to anyone—even to those individuals who exercise safety procedures to minimize the possibility. Your degree of emergency preparedness will have a direct impact on the severity of the situation if a spill occurs.</p> <p>PLAN AHEAD...HAVE EQUIPMENT AVAILABLE FOR THE SPILL EMERGENCY</p> <p>Be prepared. Missing, unavailable, and nonfunctional equipment is of no help in an emergency.</p> <ul style="list-style-type: none"> • Protective equipment for all products handled. • Absorbent material to contain a spill (Granular absorbent, absorbent pads and boom, as appropriate). • Tools for constructing temporary earthen dikes

ACTIVITY	Seeding and Fertilizing	CODE	2240
----------	-------------------------	------	------

Work Method

Work method is determined by the equipment used in the seeding process. If using hydro-seeder, fill tank to approximately 1/2 full or above the agitator inside tank. Next place water soluble fertilizer and any spreaders/stickers in with agitator activated. Continue filling with water and add grass seed and lastly hydro-mulch. Finish filling water tank and continue to agitate until ready to use.

Method 1. If using a hydro-seeder or seeding by hand there must always be seed to soil contact. There must be loose soil for roots to penetrate, if not seeds will germinate but will die shortly thereafter.

Grass stands can be improved using no-till methods to strengthen weak grass stands through the introduction of both legumes and/or grasses.

Site Preparation Steps for hydro seeding or broadcast seeding & matting.

1. Place signs and other safety devices.
2. Clear the site of all rocks , stones or other debris that is larger than 2-3 inches in diameter.
3. Initial tilling, to a depth of at least 2 inches, should be completed prior to adding any topsoil or soil amendments.
4. Apply "starter fertilizer" that is high in phosphate (P, or the middle number on a bag of fertilizer), at a rate recommended for the particular product.
5. Finish grade the entire site, maintaining the rough grading contours and slopes, with a tractor-mounted box blade on large areas or heavy-duty rake on smaller sites.
6. Apply grass seed at a rate of 170 lbs per acre or 6 pounds per 1000 sq. ft.
7. Roll the area with a lawn roller one third full of water to firm and settle the surface and reveal any low spots that should be filled to match the surrounding grade surface.
8. Cover with Matting, Laying and Stapling.
 - Start laying the matting/covering from the top of the channel and unroll down-grade.
 - Allow to lay loosely on soil –do not stretch.
 - Upslope ends of the matting should be buried in an anchor slot no less than 6-inches deep. Tamp earth firmly over material. Staple the matting at a minimum of every 12 inches across the top end.
 - Edges of matting shall be stapled every 3 feet. Where multiple widths are laid side by side, the adjacent edges shall be overlapped a minimum of 2 inches and stapled together.
 - Staples shall be placed down the center, staggered with the edges at 3 foot intervals.
9. Maintenance, all soil stabilization blankets and matting should be inspected periodically follow installation, particularly after rainstorms to check for dislocation or failure and should be repair immediately. Continue to monitor these areas until they become permanently stabilized.
10. Remove signs and other safety devices

Method 2. No-till seeding, in no-tillage planting systems, a planting is made directly into an essentially unprepared seedbed.

In addition to reducing soil erosion, no-till seeding conserve moisture already present in the seedbed. Moisture conservation, along with a dramatic reduction in water run-off, improves the water supply for the new seedlings. No-till seeding methods also require less time and fuel than traditional methods because rocks remain below the soil surface.

ACTIVITY	Seeding and Fertilizing	CODE	2240
-----------------	--------------------------------	-------------	-------------

Special Considerations

There are several rules that must be followed for no-till seeding to be successful. The five most important are:

1. Proper Soil Testing is a Must - It is a waste of time and money to try to establish or improve stands when the soil fertility and/or pH are too low to support productive plants. Fertilize and lime according to soil test recommendations prior to seeding.
2. Seed on the Proper Date - Depending on the situation, no-till seeding can be successful in late winter, spring or late summer/early fall. It is extremely important to make plans and preparations well in advance so the seeding can be made on time.
3. Use High-Quality Seed – Do not use seed that has been in storage for over 6 months, each month seed is stored it loses 5-8 % germination.
4. Control Depth of Seeding - Seeds of most forage plants are small and cannot be counted upon to emerge from a seeding depth of greater than 1/2 inch. Adjust seeding equipment to place the seed at a shallow depth of 1/4 - 1/2 inch. Placing the seed too deep is the most common single reason for failure to get a stand. If you see a few seeds on the soil surface after seeding, then your seeding depth is about right.
5. Because seeder is primarily designed for field applications, a minimum of 4 passes should be made over the entire area. These passes should be at different angles.

ACTIVITY	Tree Trimming	CODE	2250																						
Purpose	<p>The primary purpose of trimming trees is to ensure they stay healthy and grow correctly. Vegetation management is critical to maintaining the reliability of Highway users. So trees are also trimmed for safety purposes—if the branches are in a precarious position endangering the lives of passersby or at risk of causing property damage. When trees are affected by disease or insects, trimming or pruning is often the only solution possible. If extreme weather conditions have caused damage to the tree, then trimming can help the wounds heal and close faster.</p>		Category Right-of-Way <input type="checkbox"/> PM <input type="checkbox"/> QA <input type="checkbox"/> Unit Cost <input type="checkbox"/> Plan Location																						
Scheduling & Coordination																									
<p>Deciduous trees may be pruned in the dormant season once leaves have fallen in October or November, but January to March is preferred. Trimming in the dormant season is preferred to lessen the stress to the tree. Finish pruning in the spring, before color is evident in swelling leaf and flower buds. However there are no rules for pruning/trimming of trees on the Right of Way, this activity can be done any month.</p>

ACTIVITY	Tree Trimming	CODE	2250
-----------------	----------------------	-------------	-------------

Work Method
<ol style="list-style-type: none"> 1. Place signs and other safety devices 2. Consider pruning a branch if it meets any of the following criteria - <ul style="list-style-type: none"> • dead, dying or severely diseased branches. • sprouts forming at the base of the trunk • branches growing toward or across the tree's center • crossed limbs that rub together or may rub in the, future • V-shaped crotches (when possible to prune) • multiple leaders (upright branches that compete, as secondary trunks or may develop into additional, trunks) • nuisance growth (interfering with power lines, sidewalks, buildings, traffic or traffic visibility, etc.)The cut is the key to good pruning. As a rule, always cut back to a branch, twig or bud that is pointed in the direction you want the tree to grow. • This method encourages controlled, healthy new growth. If you're unsure whether to remove a branch, don't cut. You can always cut it later, but you can never put it back. • At the position where each branch originates from the trunk is a "collar" between the branch and the trunk. This branch collar contains vascular tissues from both the branch and the trunk. If you cut into the trunk tissue, you will interfere with the tree's natural protective mechanisms, allowing the entry of disease and insect pests which damage the tree trunk. Make your pruning cut outside the collar on the branch side without leaving a stub. 3. Never Top a tree! Topped trees have shortened life spans, pose safety hazards to people and property plus require continuing intensive maintenance. 4. Always start trimming on lower limbs and work your way up. Never start a cut unless all personnel and bystanders are clear. 5. Use chipper to reduce volume of waste material. 6. Haul to disposal area, dispose of waste according to INDOT environmental policy or Indiana Code. 7. Clean work area, being sure to clear roadway of any debris. 8. Remove signs and other safety devices

Special Considerations

INDOT will not maintain trees where property owners retained timber rights. Where such trees are known to exist and where hazardous to persons using the highway, INDOT will advise the owner of their responsibility to remedy the situation. Where the owner fails to take action within a reasonable period of time, INDOT will remedy the situation in the least costly method available.

INDOT will not maintain, remove or trim trees inside incorporated municipalities which are located in grassy strips between the edge of pavement and sidewalk.

NOTE: Incorporated municipalities have the responsibility for maintenance of trees to the corporate boundaries even though there are no curbs or sidewalks.

ACTIVITY	Tree Removal	CODE	2251
Purpose	Trees should be removed for safety purposes, which present a hazard buildings and roads, including the clear zone.		Category Right-of-Way <input type="checkbox"/> PM <input type="checkbox"/> QA <input type="checkbox"/> Unit Cost <input type="checkbox"/> Plan Location
Scheduling & Coordination			
All routine/ planned tree removal shall be scheduled between October 1st between March 30th. This is due to the federally endangered Indiana Brown Bat. However if an emergency danger tree is identified that proposes an immediate hazard, it may be removed if it is determined that there is no loose bark or nesting areas is on tree. If removal is started and any bat is sighted, all cutting must stop and INDOT's Environmental Section should be notified. All tree removal should be communicated/ coordinated with the adjacent property owner.			
Reporting			Reporting Units Trees
Accomplishment is the number of trees removed. The definition of a tree, as laid out by the American Forests organization, requires that the plant have one, and no more than one, woody vertical stem, and that stem must be at least 3 inches in diameter at 4 feet in height. A tree also must be at least 13 feet tall and have an indisputably spreading crown. If the woody vegetation is less than 3 inches in diameter at a height of 4 feet and at least 13 feet tall, the work should be reported to Activity 2220 Brush Cutting.

Sub Activities			
Average Daily Production	1-4 Stumps Removed	EFFECTIVE DATE	July 1, 2013

ACTIVITY	Stump Removal	CODE	2260
-----------------	----------------------	-------------	-------------

Work Method

1. Place signs and other safety devices
2. Observe all safety precautions, install safety shields and guards.
3. Start by using a shovel or garden mattock to remove any rocks from around the base of the stump. This is important because rocks can dull or damage the teeth on the cutting wheel.
4. Use a chain saw to carefully trim the stump close to the ground. You could skip this and start right in with the grinder, but this extra step speeds up the job.
5. Use the hydraulic lever to raise the grinder wheel a few inches above the stump. Drive the machine forward to position the wheel directly over the stump's front edge. Start the wheel spinning and slowly lower it about 3 in. into the stump. Use the hydraulic lever to slowly swing the wheel from side to side to clear out the wood. After you've dug down at least 4 in., raise the wheel, advance the machine a few inches, and repeat the process. While operating the machine, always stand at the control panel, which is located near the rear of the machine and well away from the cutting wheel.
6. Little by little, continue to grind your way through to the other side of the stump.
7. Load and haul chips to disposal area
8. Check to make sure that the freshly dug hole is at least 4 in. below the ground. Rake up all the wood chips and fill the crater with topsoil.
9. Tamp down and lightly rake the soil. Spread out an even layer of grass seed, and then rake the seeds into the soil. Water the area and cover the seeds.
10. Clean and smooth work area
11. Place grass seed on site
12. Remove signs and other safety devices

Average Daily Production	21,780-43,560 Sq Ft	EFFECTIVE DATE	July 1, 2014

ACTIVITY	Spot Mowing	CODE	2270
-----------------	--------------------	-------------	-------------

Work Method
<ol style="list-style-type: none"> 1. Place signs and other safety devices 2. Observe all safety precautions when mowing around property off right of way, units and sub-district buildings check for hidden objects that may be thrown from mower. 3. Check safety equipment on tractor and mower, all guards in place and working properly. 4. Check and adjust mower height to the correct mowing height to between 3 to 8 inches. No less the 3 inches when mowing yards and 6 to 8 inches when mowing on Right of Way. This is the most important work method the operator has control over, if mowed less than 6 inches the grass root system is damaged allowing weeds to fill in areas covered by grass. When mower scalps or digs into ground the area is prone to invasive species to fill in the area. Proper mowing height will also extend the life of all equipment used to mow and cost to maintain. 5. Lubricate tractor and mower grease fittings daily. 6. Mow only those areas necessary to eliminate safety hazard or ensure that the noxious or invasive species will not flower or seed. When mowing sight distance areas mow with flow of traffic starting at road shoulder, intersections should be mowed to ensure safe sight distances when in a small vehicle, if in doubt mow extra to ensure safe sight line. 7. When mowing yards ensure grass is not discharged in the direction of sidewalks or parked cars. Do not mow where people are at risk of being hit by an object struck by mower. 8. Clean equipment by sweeping with broom within the mowed area after cutting any invasive or noxious plant. This will reduce the spread and cost to control these species 9. Remove all signs and other safety devices.

ACTIVITY	Right-Of-Way Fence	CODE	2280
-----------------	---------------------------	-------------	-------------

Work Method

1. Place signs and other safety devices
2. Remove any damaged fence and posts, salvage material if possible in the fence .
3. Measure the width and length of the hole,
4. Replace any T-posts that were damaged, they should be every 10 feet. T-posts have "blades" on them that should be buried at least 2 feet for a 5 foot fence.
5. Unroll a new roll of woven wire and cut a piece that is a minimum 12 inches longer than the hole you are patching.
6. Attach the fence to one corner/anchor post(Anchor post should be every 50-75 feet) with U staples/nails, and then put a temporary post in the ground beyond the other end, which you will attach the pulley to in order to stretch the fence. (Tractor may be used as anchor to stretch fence)
7. The fence should be stretched until the little V shaped crimps in it become about 1/3 straighter.
8. Start at the end furthest away from stretcher and began attaching the clips to fence. 5 clips per post is recommended, make sure the top of the fence is over one of notches on the post.
9. When all fencing has been attached, remove stretcher, pick up tools.
10. Remove signs and other safety devices

INDIANA DEPARTMENT OF TRANSPORTATION
DIVISION OF MAINTENANCE
WORK PERFORMANCE STANDARD

ACTIVITY	Major Cleaning & Reshaping Ditching	CODE	2310
Purpose	<p>The primary purpose of this activity is for excavating large amounts of soil or digging long distances to restore drainage along the roadside. This activity may be used to reshape ditches so a vehicle leaving the roadway can cross over them without the vehicle overturning, being abruptly stopped or causing the driver to lose control.</p>		Category Roadway/Drainage <input checked="" type="checkbox"/> PM <input checked="" type="checkbox"/> QA <input checked="" type="checkbox"/> Unit Cost <input checked="" type="checkbox"/> Plan Location
Scheduling & Coordination			
<p>Schedule this work on ditches which have standing water, have obstructions. Emphasis should be on ditches with excessive silting and blocked drainage structures. This should be done during the growing season, when it's easiest to reestablish vegetation. For large areas this is from mid-August through October, (lowest amounts and less intense rainfall events). Dredging shall be conducted during low water periods and "in the dry."</p> <p>Ditching Excavation area that is needed to be removed should be marked prior to the date of actual work. The amount will be determine by fixed flow elevation points (i.e. culvert inlets/outlets, catch basin inlets, etc.).</p> <p>Plan for installation of temporary erosion & sediment control measures. Coordinate with underground utilities</p> <p>This activity should also plan where to dispose of excavated material that are close to the work area. First choice should be to used on R/W, where washout/ erosion are accruing or where poor soil conditions exist.</p>			
Reporting	Reporting Units		Linear Feet
<p>Accomplishment is the total linear feet of ditch dug.</p> <p>Only report continuous ditching of greater than 200 feet to this activity. Areas reported to this activity that are greater than 500 linear feet of excavated material shall have a survey of drainage area to be cleaned by a qualified person. Survey will consist of both depth elevations and finished transverse slopes and erosion control plans. A copy of this survey must be attached to the work order.</p> <p>If waste material will be disposed of on private property, ensure an "Excavation Material Disposal" form is completed. Attach a copy of this form to the work order.</p> <p>Ditching that is less than 200 feet shall be reported to Spot Ditching (Activity 2311). Cleaning paved side ditches is reported to Other Drainage Maintenance (Activity 2390, Sub-Activity 819)</p>

ACTIVITY	Major Cleaning & Reshaping Ditching	CODE	2310
-----------------	--	-------------	-------------

Work Method			
<ol style="list-style-type: none"> 1. Place signs and other safety devices 2. Install silt/sediment control devices where needed to keep all material on R/W. 3. Survey the ditch bottom and adjacent culverts to determine where sediment has accumulated. If this hasn't already been identified by survey. 4. Identify any underground utilities and hand dig areas to proper elevations, 24 inches on each side of painted marks. This should be done while excavator is working in areas with no utilities. 5. When excavating excess material from a ditch, return the ditch to the original design depth and location. Over-excavation and undercutting can result in slope failure, road failure, and ditch head cutting. 6. Remove material and debris from ditch with excavator to allow drainage and load in trucks. All efforts shall be made to retain existing vegetation, especially along the ditch slopes to maintain slope stability. Careful precaution shall be taken as not to disturb vegetated ditch areas not requiring dredging. 7. The side slopes of the ditch/channel should not exceed the angle of repose of the soil comprising the ditch line, and should generally be 3:1 or flatter. Re-establish uniform flow line, taking care to avoid low spots which will accumulate water. 8. Avoid creating a "V" or cup bottom ditch, V-shaped ditches concentrate flow, become incised, and erode sediment 9. Dispose of waste according to INDOT environmental policy, INDOT is responsible for the proper disposal of items taken from INDOT's right-of-way. 10. Dress and shape fore-slopes and back slopes. Avoid creating steep slopes whenever possible. 11. Prepare area to be treated, ditch side slopes shall be seeded and mulched as soon as possible. 12. Apply fertilizer, seed and mulch side slopes as appropriate to prevent subsequent erosion. 13. Ditch cleanings are not to be left on the roadway surfaces. Sweep dirt and debris remaining on the pavement at the completion of ditch cleaning operations. 14. Remove signs and other safety devices 15. Remove silt/sediment control devices after permanent vegetation cover as been established. 			

Special Considerations			
<p>When disposing of ditching material off of state property, utilize the "Excavation Material Disposal Site" form. Attach a copy of this form to the work order.</p>

District/ Sub district: _____ Evaluation Date: _____
 Location : _____ Route: _____ RP Start: _____ End: _____
 Date Project completed: _____ Evaluated by: _____

QA Type: 60-90 days (initial) None (follow-up) Final Score: 0%

OBSERVATIONS:

- 1 **Pipe inlet is prepared**
 - 0 Ditch not cleaned for pipe installation
 - 5 Ditch cleaned and open to pipe Points: 0.00

- 2 **Liner properly installed**
 - 0 Bowing or floating of pipe has occurred
 - 10 Pipe liner is in proper positions Points: 0.00

- 3 **Pipe inlet and outlet properly grouted**
 - 0 Grout missing from inlet and/or outlet
 - 10 Grout fully surrounding pipe insert on both ends Points: 0.00

- 4 **Voids adequately filled**
 - 0 Grout holes are not drilled or completely filled
 - 5 Grout holes are only partly filled with grout
 - 10 Grout holes are present and properly filled Points: 0.00

- 5 **Liner correct size for application May refer to liner chart**
 - 0 No
 - 10 Yes Points: 0.00

- 6 **Inlet side- liner adequately fits existing pipe**
 - 0 Liner extends beyond ditch line and obstructs ditch flow
 - 10 Liner extends beyond the pipe but not the ditch line
 - 15 Liner does not extend beyond the pipe, and ditch line or liner extends beyond pipe and shoulder improved. Points: 0.00

- 7 **Outlet side- liner adequately fits existing pipe** Points: 0.00
 - 0 Liner extends beyond ditch line and obstructs ditch flow
 - 10 Liner extends beyond the pipe but not the ditch line
 - 15 Liner does not extend beyond the pipe, and ditch line or liner extends beyond pipe and shoulder improved.

Sub Activities			
Average Daily Production	4 - 7 Bridges	EFFECTIVE DATE	7/1/2016

ACTIVITY	Bridge Cleaning	CODE	2410
-----------------	------------------------	-------------	-------------

Work Method

- 1) Place signs and safety devices
- 2) Using Sweeper/Broom/Vacuum Truck equipment clean bridge deck surfaces
- 3) Use hand tools to loosen debris from joints, drains, gutter lines, sidewalks and other areas where dirt or debris has collected
- 4) Blow out joints, drains, truss members and other bridge components where debris has collected
- 5) Sweep or vacuum materials to be removed
- 6) Hand clean around bridge seats, mudwalls, bearing assemblies, beam ends and slopewalls
- 7) Load materials into haul vehicles
- 8) Dump waste materials at a designated dump location only
- 9) Remove signs and safety devices

Special Considerations

- Key components to clean are most often joints, drains, bearing assemblies, and bridge seats.
- If all of the bridges to be cleaned in a 7.5 hour time period have bridge seats, bearing assemblies, and beam ends which require cleaning the anticipated average daily production is 4 bridges. If none of the bridges to be cleaned in a 7.5 hour time period have bridge seats, bearing assemblies, and beam ends which require cleaning the anticipated average daily production is 7 bridges.

Sub Activities			
Average Daily Production	240-320 Linear Feet	EFFECTIVE DATE	7/1/2013

ACTIVITY	Cable Barrier Repair	CODE	2530
-----------------	-----------------------------	-------------	-------------

Work Method

1. Place signs and other safety devices
2. Check for damaged parts. There may be damaged parts beyond the actual impact area.
3. Remove all debris and damaged parts
4. If a cable is broken, cut frayed/damaged sections from the ends and splice in a new section using turnbuckles
5. If foundations are damaged beyond use or misaligned, they will need to be replaced.
6. Install new posts in existing sleeves
7. Install cable onto posts with appropriate hardware to the system
8. Check tension with tension meter at nearest turnbuckle. Adjust turnbuckle until tension meter reads correct tension, per the vendor's tension chart. Note that tension is temperature dependent.
9. Ensure a yellow reflective sheeting delineator is placed on the traffic side of every fourth post
10. Clean up debris and work area
11. Remove signs and safety devices

Special Considerations

INDOT maintains an approved list of cable barrier systems. Ensure that the replacement parts match the existing system. INDOT has spare parts QPA's for each system, which list the specific parts.

If the system is impacted greater than 300 feet from a turnbuckle, make sure to check tension at the nearest turnbuckle in both directions.

ACTIVITY	Impact Attenuator/Guardrail End Treatment Inspection	CODE	2551
-----------------	---	-------------	-------------

Work Method

1. Follow appropriate safety precautions
2. Inspection must be conducted hands on, not from a vehicle.
3. Visually inspect unit per the schedule below
4. Record the type of unit, location, and any needed repairs on the inspection form.

Any needed repairs identified during inspection will need to be corrected with either in-house forces or contract. A work request for such repairs will be created for Activity 2550.

System	Hands-On Inspection Frequency	What to Look For
Guardrail End Treatments	4 Years	Cable taugt, nuts tight
		Blockouts and posts not deteriorated or damaged
		Rail panels not deteriorated or damaged
		All bolts and nuts snug
		Ground under and in front of unit free of debris
		Delineation Panel present, visible, no deterioration
		Ensure extruder head is properly attached to rail
Gravel Barrels	4 Years	Barrels show no signs of cracks
		All lids locked down
		Ground under and in front of unit free of debris
Impact Attenuators	1 Year	Cables taugt, not sagging
		Diaphragms and bays all straight
		All rail panels tight, not deteriorated or damaged
		Cartridges/Rip Plates not deteriorated or damaged
		Cylinders show no signs of cracks
		All bolts and nuts snug
		No misaligned parts
		Ground under and in front of unit free of debris
Delineation Panel present, visible, no deterioration		

Special Considerations

For inspecting contract new installations or repairs, the inspector shall be certified on the unit being inspected. Minor repairs, such as tightening bolts, may be done during inspection.

ACTIVITY	RPM Casting Inspection and Removal	CODE	2560
-----------------	---	-------------	-------------

Work Method

For RPM Casting Inspection:

1. Place signs and safety devices
2. Manually check all RPM castings to ensure they are tight and secure in the pavement
3. Remove loose RPM castings
4. Record missing or removed reflectors
4. Patch holes left by removed or missing castings
5. Remove signs and safety devices

Properly dispose of all removed castings.

For RPM Reflectivity Inspection:

1. Drive roads with RPM's at night in dry weather.
2. Note how far reflectors are visible. Note number of missing reflectors.
3. Note condition on attached form.

ACTIVITY	Emergency Maintenance	CODE	2610
-----------------	------------------------------	-------------	-------------

Work Method

Respond and restore safe driving conditions for emergencies caused by:

Subactivity 722 - Damage to an INDOT Structure

1. Investigate and report all damage of INDOT's assets for claims recovery.
2. Place temporary warning devices to warn motorists such as stop barrels, traffic barrels and signage.
3. If a structure is not passable and a closure is necessary then follow the temporary road closure policy.

Subactivity 723 - Isolated Surface Defects

1. Investigate the cause of the surface defect.
2. Temporary signs can be placed or holes patched with an aggregate containing lime.

Subactivity 724 - Roadway Debris Removal

1. INDOT may use state equipment to move objects to the shoulder of the road to expedite safe driving conditions

Subactivity 725 - Other Emergency Maintenance

1. Investigate and place temporary devices or perform temporary repairs not specified above.

Subactivity 726 - Settlement

1. Investigate the cause of the settlement.
2. Place warning signs.
3. Aggregate with lime may be used as a temporary means to level the roadway.
4. If the road is not passable and a closure is necessary then follow the temporary road closure policy.

Subactivity 727 - Slides and Fallen Rocks

1. Remove debris from roadway and examine the roadside for stability to determine if further action is needed.
2. If a road is not passable and a closure is necessary then follow the temporary road closure policy.

Subactivity 728 - Washouts and High Water

1. For minor flash flooding place high water signs to warn motorist to prevent hydroplaning.
2. For roads that are not passable and a closure is necessary then follow the temporary road closure policy.

NOTE: FEMA reporting: All Natural Disasters should be reported to the appropriate work activity; not 2610. This activity is for initial response (within 48 hours) only to keep roads passable.

Special Considerations

This activity is designed for only temporary repairs or action. If permanent repairs are made they should be charged to the appropriate activity.

43 - Designated Loader Operator				
Average Daily Production		142.5 Miles	EFFECTIVE DATE	1/1/2015

ACTIVITY	Snow and Ice Removal	CODE	2630
Work Method			
Sub Activity 41 - Anti-Icing:			
<ol style="list-style-type: none">1. To anti-ice you will select the available equipment needed to apply liquid deicers.2. Load the tank with salt brine. A product used to enhance the brine may also be used as a blend.3. Specific loading instructions for available materials are required.4. Chemicals are applied at a rate of 20 to 80 gallons per lane mile at normal posted driving speeds.5. Specific application rates for forecasted conditions are required as to spot treat or to treat all lanes.			
Sub Activity 42 - Plowing & Spreading:			
Deicing Work Method			
<ol style="list-style-type: none">1. To de-ice you will select the available equipment needed to apply liquid or solid deicers.2. Load the tank, pre-wet tank and or spreader bed with the desired product available.3. Only one truck is allowed in the loading/unloading area at any one time.4. No one is permitted in the staging area.5. Drivers not loading/unloading their own trucks must stay inside the cab until they are no longer in the staging area.6. Trucks and loaders are to be kept on a level surface.7. Do not overload trucks.8. Distribute the loads evenly.9. Avoid movements that result in striking the truck and or spreader with the loader bucket.10. Do not get out of the loader with the loader bucket in an elevated position.11. Never leave a vehicle running unattended.12. Keep the loader bucket as low as possible at all times.13. Avoid and cleanup spillage regularly.14. Specific product instructions are required. Material selection is based on the goal of the intended application, current road conditions, temperatures, and forecasts.15. Application rates will range from 25 lbs to 400 lbs per lane miles for granular products and 20 gallons to 150 gallons per lane mile for liquid products. Specific application instructions are required.			
Plowing Work Method			
<ol style="list-style-type: none">1. Plowing is intended to remove as much snow and loose ice as possible before applying chemicals.2. Plowing is the the only method that is needed if the pavement is both and cold and dry and the snow is not adhering to the pavement. Specific plowing instructions are required.			
Snow Hauling Work Method			
<ol style="list-style-type: none">1. This is the process of using mechanical equipment to load snow onto trucks to be hauled to a stockpile area to melt. This is done when additional space is required to plow new forecasted snowfall and to prevent refreeze from melted stockpiled snow.2. Load snow onto trucks.3. Do not overload.4. Distribute load evenly.5. Dump snow at designated site.6. Only one truck allowed to unload at a time.			

ACTIVITY	Snow and Ice Removal (Continued)	CODE	2630
-----------------	---	-------------	-------------

Sub Activity 43 - Designated Loader Operators

Loader Operations Work Method

1. Loader operators will only allow one truck in the staging area at a time.
2. Drivers are required to stay in the vehicle and not allowed on foot in the staging area.
3. Loaders are to be kept on a level surface.
4. Do not overload trucks.
5. Distribute the loads evenly.
6. Avoid movements that involve striking the truck or spreader with the loader bucket.
7. Do not get out of the loader with the bucket in an elevated position.
8. Do not leave the loader running unattended.
9. Keep the loader bucket as low as possible at all times.
10. Avoid and cleanup spillage regularly.

ACTIVITY	Snow and Ice Removal	CODE	2630
-----------------	-----------------------------	-------------	-------------

Special Considerations

This activity should be performed in an effort to maintain or return roadways to a safe driving condition. This is achieved by snow & ice strategies such as anti-icing, de-icing, plowing, spreading, or spraying. The appropriate timing of any strategy will require the use of sound judgement, interpretation of available weather data, and prompt action. Anti-icing is the process to prevent bonding of snow and ice to the pavement by placing chemical prior to the storm or frost condition. De-icing is the process of breaking the bond of snow and ice from the pavement after it has formed. Plowing is the process of removing as much snow or loose ice prior to applying chemicals in anti-icing and de-icing operations or to remove a dry snow that is not adhering to the pavement. Spreading is the mechanical process of applying dry or pre-wet deicing chemicals to the roadway to melt or break the bond. Spraying is the mechanical process of applying liquid deicers to the roadway to melt or break the bond.

Designated loader operator is the manpower assigned to operate the loader for the purpose of mixing and loading materials.

Sub Activities					
Average Daily Production		4,000 – 8,000 gallons		EFFECTIVE DATE	July 1, 2013

ACTIVITY	Brine Mixing	CODE	2640
-----------------	---------------------	-------------	-------------

Work Method

INDOT has a variety of brine makers from in-house home-made to state of the art computer controlled models. Regardless of the type they all require that salt be added to a hopper and then filled with water to dissolve the salt into a liquid solution known as brine. The solution is then monitored to ensure that it has reached the desired concentration. A Hydrometer is a tool that is used to measure the concentration percentage of salt ions in the water. The correct specific gravity for the brine solution is 23.3 percent. Manual machines will require the use of a Hydrometer. The newer computer automated systems have this ability built into the brine maker. Once the solution is at the desired concentration it is then pumped into storage tanks for operational use.

1. Load salt into your brine maker hopper.
2. Fill your hopper with water to dissolve the salt into a brine solution.
3. Test your dissolved brine solution with a hydrometer unless your system is automated and has this feature built in.
4. The brine solution level is to read a specific gravity of 23.3 percent.
5. The brine is then pumped into storage holding tanks.

Special Considerations

Perform this activity prior to the winter months and throughout the winter as needed, to maintain an adequate supply of brine.

Review weather to determine material need and try to schedule within a normal working hours shift.

Salt needs to be clean.

Periodic flushing and cleaning of the brine maker is required.

Average Daily Production	Person hours	EFFECTIVE DATE	July 1, 2013

ACTIVITY	Stockpiling Winter Materials	CODE	2650
-----------------	-------------------------------------	-------------	-------------

Work Method

INDOT's practice and policy is to keep all deicing materials and mixes under roof and on a impermeable surface. Material is to be handled as little as possible in an effort to decrease or eliminate spillage, material degradation, and unwanted moisture.

A. Stockpiling/Transferring:

1. Only one truck is allowed in the loading/unloading area at any one time.
2. No one is permitted in the staging area.
3. Drivers not loading/unloading their own trucks must stay inside the cab until they are no longer in the staging area.
4. Trucks and loaders are to be kept on a level surface.
5. Do not overload trucks.
6. Distribute the loads evenly.
7. Avoid movements that result in striking the truck and or spreader with the loader bucket.
8. Do not get out of the loader with the loader bucket in an elevated position.
9. Never leave a vehicle running unattended.
10. Keep the loader bucket as low as possible at all times.
11. Avoid and cleanup spillage regularly.

B. Deliveries:

Delivered materials require that the load is visually inspected for contamination before and after dumping. Material tickets must visually be inspected to ensure proper delivery location and material type. No liquid material may be placed in a tank that is not properly marked and identified. Not all liquids are compatible.

Special Considerations

Tractor/Loader Operator	1		
Job Specific Equipment		Materials	
Tractor	1	Warm-season grass /Forbs seed	
No-till drill	1	Tree Seedlings or Plant plugs	
Tree seedling Planter	1	Trees, Balled& Burlap or Potted	
Plug/ seedling hollow dibble	3-5	Steel fence post	
Post driver	1	"Do not Mow or Spray" signs	
		Other References	
Sub Activities			
Average Daily Production	4 to 8 Acres	EFFECTIVE DATE	July 1, 2013

ACTIVITY	Natural Snow Fence	CODE	2670
-----------------	---------------------------	-------------	-------------

Work Method

1. Insert dibble blade 1-2" deeper than the length of the seedling's roots at angle shown and push straight up.
2. Remove dibble and place seedling at correct depth (same as or ½" deeper than at nursery). Make sure there is no dry grass sticking in the hole with the tree that could act like a wick and dry out the soil around the tree.
3. Insert the dibble 2 inches toward you from seedling and pull the handle toward you, firming the soil at the bottom of the roots. This is to prevent an air pocket at the bottom of that will dry out the roots and kill the tree
4. Push the handle away from you, firming soil at top of roots.
5. Repeat steps 3 and 4 about 2 inches on the other side of the tree to firm the soil evenly.
6. Fill in the hole by stamping with heel. Heel in all around the tree to make sure there are no air pockets.

Establishing Native Warm-Season Grasses (NWSG)

1. NWSG grow during the summer months, thus are usually planted in late spring or early summer. Dormant plantings may be made after Dec. 1, if the soil has thoroughly cooled. Increase the seeding rate 25 to 50 percent for dormant seeding to compensate for seed that will be eaten by rodents or rot before spring.
2. NWSG may be planted into clean-tilled seedbeds or killed sods. Clean-tilled seedbeds should be fine textured and firm, preferably rolled. Several methods work well.
3. NWSG may be planted on killed cool-season grass sods using a rangeland or no-till drill capable of handling chaffy or de-bearded seed.
4. Seed depth should be no more than 1/4 inch to 1/2 inch for all NWSG. Weeds, especially grassy weeds such as giant foxtail, should not be allowed to grow more than 18 inches tall before mowing.
5. Mow to a height of 6 to 8 inches the first season. Cease mowing after early August to avoid disrupting root carbohydrate storage of the native grasses.

Special Considerations

The area should be free of noxious weeds prior to seeding or planting. Adjacent property owners shall be contacted prior to work to explain purpose of planting. Type of material to be planted will affect crew size and equipment.

Common Mistakes That Will Kill Seedling/Plant Plugs

1. Storing seedlings/plants in a bucket of water for more than 1-2 hours.
2. Planting too deep or too shallow.
3. Allowing roots to curl back toward the top of the hole.
4. Not allowing proper root spread.
5. Planting in sod without good site preparation.
6. Leaving in boxes exposed to the sun.
7. Planting in dry soil.
8. Planting a species not adaptable to the site.
9. Keeping trees in boxes more than a few days without cold storage.

ACTIVITY	Other Winter Maintenance	CODE	2690
-----------------	---------------------------------	-------------	-------------

Work Method

A. Winter Operations:

1. Attach plows and spreaders on the trucks.
2. Check to ensure that the safety pins and straps are locked securely holding the plow and spreader in place.
3. All hydraulic hoses are to be attached and then operated to check for leaks and to ensure equipment is properly performing.

B. Calibrating Equipment: Equipment shall be calibrated each year and any time during the season if the hydraulic pump or control box has been changed equipment should be re-calibrated to ensure the proper amount of material is being dispersed.

1. Warm truck's hydraulic oil to normal operating temperature with spreader system running.
2. Put partial load of salt on truck.
3. Mark shaft end of auger or conveyor.
4. Dump salt on auger or conveyor.
5. Rev the truck engine to operating RPM (at least 2000 RPM).
6. Count number of shaft revolutions per minute at each spreader control setting, and record.
7. Collect salt for one revolution and weigh, deducting weight of container. (For greater accuracy, collect salt for several revolutions and divide by this number of turns to get the weight for one revolution.)

When to recalibrate

- When the spreader/controller unit is first put into service.
- Annually, before snow and ice control operations begin.
- After major maintenance of the spreader truck is performed and/or after truck hydraulic fluid and filters are replaced.
- After the controller unit is repaired or when the speed (truck or belt/auger) sensors are replaced.
- After new snow and ice control material is delivered to the maintenance garage.

Sub Activities			
Average Daily Production	Person Hours	EFFECTIVE DATE	7/1/2013

ACTIVITY	Materials Handling and Storage	CODE	2840
-----------------	---------------------------------------	-------------	-------------

Work Method

Examples of work to report to this activity are:

1. Pipes - hauling pipe from vendor to unit for storage, staging or organizing in yard.
2. Signs and sign posts - staging or organizing in yard, unloading sign order from LSC delivery truck
3. Bituminous material - sending a tanker to emulsion plant, hauling cold mix from vendor
4. Aggregates - hauling from quarry to unit or remote stockpile, staging in yard
5. Guardrail - hauling parts from vendor or District lot to unit
6. Paint - unloading delivery truck.
7. Transporting salvage material from a contract to an INDOT location.

Special Considerations

Materials should be handled as little as possible to minimize damage, segregation, spillage, and degradation. Utilize proper loading techniques at all times. Improper material handling can cause issues if INDOT tries to go back on a material supplier for not meeting specifications.

Work Method
<ol style="list-style-type: none"> 1. Review sign log 2. Call in locates 48 hours before road section will be resigned. Any anchor or post that will be driven or removed from the ground requires a locate. (This does not include removing post from anchor) 3. Ensure all signs for the day are loaded on the vehicle as well as any posts and hardware that may possibly be needed. 4. Place work area safety devices. 5. Refer to Standard Drawings to determine proper height and offset from roadway or walkway, and sign size. 6. Measure offsets and heights of current sign. Laser or line level may be required to determine height above roadway. 7. Determine if current post and anchor can be reused or if sign needs to be moved to meet current standards. If new post is required, refer to Sign Post Selection Guide. Signs shall not be placed on utility posts unless a separate agreement with the utility exists. 8. If the sign is leaning, the post and anchor need to be removed and re-driven. No more than 2" of the anchor shall remain above the ground. 9. Remove existing sheet sign. May use latter/lift to remove sign from post or remove post and sign from anchor, then remove the sign while on the ground. 10. If a new post is required, cut the post to correct length to achieve proper height of the sign. Secure in anchor with corner bolts. 11. Install date sticker on what will be the lower back corner of the sign that will be closest to the roadway. 12. Attach sign to post with new hardware. Lock washer and nut or lock nut shall be on the back of the sign, nylon then metal washer on the sign face. Holding bolt head against sign face, tighten nut from the back of the sign. Nuts shall be tightened sufficiently to hold sign firmly to post, but caution should be used not to twist sign sheeting. 13. Step back and review installation. Ensure no obstructions are present, and that the sign is correctly installed. 14. Collect tools and all materials. Ensure the worksite is free of debris. 15. Remove work area safety devices and move to next location.

Special Considerations
<p>Crews should be provided with a packet of Standard Drawings applicable to sign operations If drilling holes in the sign, drill from the front of sign to reduce sheeting tear.</p>

ACTIVITY	Panel Sign Maintenance	CODE	8120
-----------------	-------------------------------	-------------	-------------

Work Method

Schedule required traffic control

1. Place work zone safety devices
2. Inspect structure, sign, footers to determine which materials are needed to effect repairs.
3. If possible, make repair at this time or ensure safety of structure and motoring public (ie: lay sign down, bring sign/structure to shop).

On site repairs.

4. Reset I-beam, replace keeper plates and nuts bolts and washers as needed. See standard drawing E 802-SNGP-05 for torque values
5. Replace demountable copy, shields, panel bolts, etc. if necessary
6. If repairs cannot be made in the field, remove sign and or structure and transport to shop for repairs
7. Clean area of debris
8. Remove traffic control devices
9. Order materials for sign repair from LSC, panels, I-beams, fuse plates ect.
10. Effect repairs on sign or structure and transport to site and re-install
11. Schedule traffic control if necessary
12. Transport to site and re-install panel sign
13. Clean area of debris
14. Remove traffic control

Mobilize to next assignment

Special Considerations

When new footers are required, the installation shall meet current design standards as specified in the Manual on Uniform Traffic Control Devices and Wide Flange Post Selection Table from the Standard Drawings.

CHIEF ENGINEER	DATE

KEEPER PLATE

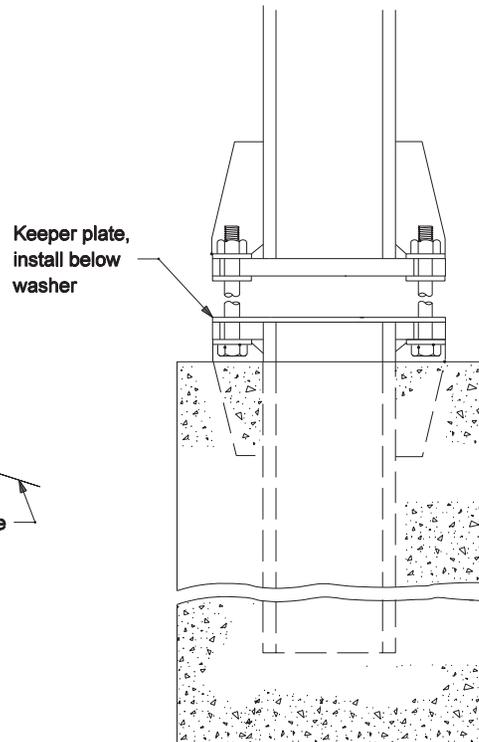

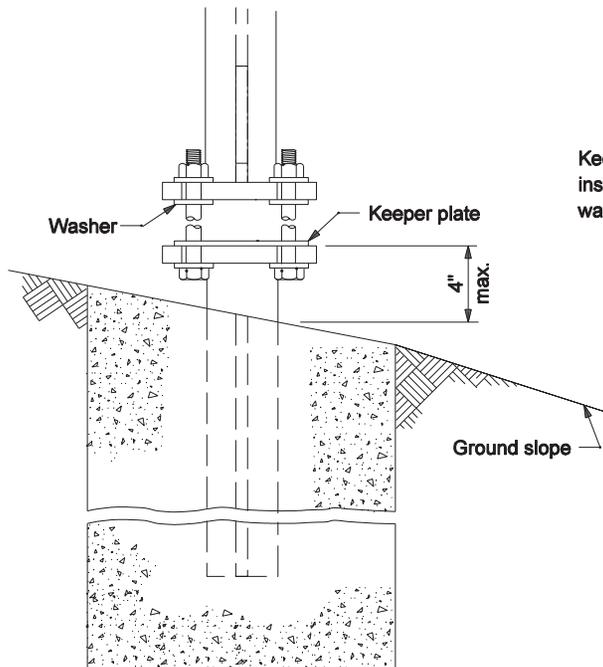

PROCEDURE FOR ASSEMBLY OF BASE CONNECTION:

Assemble post to stub with bolts. One flat washer on each bolt shall be placed between the top of the keeper plate and bottom of the top base plate. Shim as required to plumb post.

Tighten all bolts the maximum possible with 12" to 25" wrench to bed washers and shims and to clean bolt threads, then loosen each bolt in turn and retighten bolts in a systematic order to the prescribed torque. See table on Standard Drawing E 802-SNGP-05 for dimensions.

Burr threads at junction with nuts using a center punch to prevent nut loosening.

Stubs shall be plumb and base plate shall be leveled and physically held level until the concrete sets.

ACTIVITY	Delineation Maintenance Program	CODE	8140
Purpose	The periodic replacement and repair or new installation of delineators on the highway system to provide adequate safety for the motorists. Delineators are installed in a series to indicate the alignment of the roadway, in accordance with the standards specified in the Manual on Uniform Traffic Control Devices	Category	Roadway/Drainage
		<input type="checkbox"/> PM <input type="checkbox"/> QA <input type="checkbox"/> Unit Cost <input type="checkbox"/> Plan Location	
Scheduling & Coordination			
Perform this activity as required throughout the year.			
This activity can be performed in most weather conditions and is an ideal activity when crews are unable to complete their scheduled activity. (Example: Paint crew cannot paint due to rain or equipment failure)			
Reporting		Reporting Units	Delineators
Each repair or installation of a delineator assembly is one accomplishment.			
Posts used to mark assets (drains, culvers, etc) should not be reported to this activity. Reflective delineators should not be used to mark these assets.			
Roadway crews that are primarily performing a different activity for the day, but repair one or two delineators during the course of the day may report the time and materials under the primary activity. However, there will be no accomplishment reported for the delineators repaired.			
Reflectors repaired or installed on barrier wall or guardrail shall be reported to activity 8390

ACTIVITY	Delineation Maintenance Program	CODE	8140
-----------------	--	-------------	-------------

Work Method

If anything is removed from the ground without a sleeve / anchor remaining or if a delineator posts will be driven into the ground, call in for locates at least 48 hours before work.

Management or supervisors should review routes for damaged delineation.

1. Place Traffic Control devices if needed.
2. Install, replace, or repair delineators on assigned routes and at specific locations. Delineators should be spaced 200 to 530 ft, on mainline tangent sections and 20 to 90 ft on horizontal curves or ramps; Refer to table 3F-1 in the MUTCD.
3. Install delineators 2 ft to 8 ft outside the outer edge of the shoulder; remain consistent with offset whenever possible; the color of the retroreflector device shall match the edgeline paint. Delineators should be mounted on suitable supports at a mounting height, measured vertically from the bottom of the lowest retroreflective device to the elevation of the near edge of the roadway; approximately 4 feet.
4. Remove work area safety signs and devices if they were placed.

Special Considerations

APPROVED BY

 Director, Highway Maintenance

ACTIVITY	Detour Work	CODE	8150
-----------------	--------------------	-------------	-------------

Work Method
<ol style="list-style-type: none"> 1. Review detour plan. 2. Ensure all materials are available at job site. 3. Placement of detour shall start opposite to the flow of traffic. <ul style="list-style-type: none"> Place all signs on detour route before closure site. Closure site is at the start and finish point of detour Place road closed signs at starting point of detour and install barricades to begin traffic detour Place road closed signs and barricades at opposite closure site of detour (complete this simultaneously if possible) Last signs to be placed are the road closed signs and barricades at closure point if this point is different than the start of the detour. Closure site is when detour begins and ends; Closure point is actual work site. 4. Place appropriate lighting as necessary. Must be placed before sunset. 5. Drive through to ensure detour is performing as planned. 6. Perform any maintenance or changes to the detour as required throughout detour period. 7. Remove detour starting at closure point and work backward through the detour in both directions at the same time if possible. If not possible, remove signs and barricades at closure point and work back to closure site, remove signs and barricades at this location; return to closure point and remove signs and barricades in opposite direction from closure point to closure site; the road is now open; remove signage from detour route. <p>Notify vendor the same day of opening to pick up rented materials.</p>

Special Considerations
<p>Special signs may be needed to notify motorist of businesses that are still open if closure site is different than closure point.</p> <p>Pre-detour signs can be placed up to two weeks in advance of closure to communicate the coming event</p>

ACTIVITY	Traffic Sign Work Orders	CODE	8200
-----------------	---------------------------------	-------------	-------------

Work Method

1. Review work order
 2. Call in locates 48 hours before work will be performed
 3. Place safety devices as necessary
 4. Remove signs, posts, and anchors according to work order.
 5. Refer to Standard Drawings for proper offset, height, and sign size
 6. At work site, check offsets of posts and get grades using laser or line level
 7. If new post is required refer to Sign Post Selection Guide
 8. Install new post anchor if needed; refer to sign post selection guide; measure offset from roadway or shoulder; install anchor, only 2" of anchor above grade; use laser or line level to determine length of post required
 9. Cut post to proper length determined by road class and sign location; insure ditch or back slope are considered when measurements are calculated.
 10. Bolt sign to post; insure proper hardware are utilize, lock washer and nut or lock nut on back side of sign, nylon and metal washer on sign face; holding bolt head to sign face, tighten nut from backside. nuts shall be tightened sufficiently so that the sign is held firmly against the post. Caution should be used not to twist sign sheeting.
 11. Install date sticker on back lower corner closest to the road.
 12. Install Post in anchor with corner bolts
 13. Step back and review installation . Ensure no obstructions and that sign is correctly installed
 14. Collect tools and all materials and ensure worksite is free of debris
 15. Remove safety devices
- Move to next sign location

Special Considerations

Crew should be provided with a packet of Standard Drawings applicable to sign operations.
 If drilling holes, drill from front of sign to reduce sheeting tear.

ACTIVITY	Paint Centerline	CODE	8300
----------	-------------------------	------	-------------

Work Method	<ol style="list-style-type: none"> 1. Set up control points if needed. 2. Visual inspection of paint guns, filters, air compressor, paint and bead lines; looking for obvious signs of leaks, clogged paint or bead shrouds, loose connections, worn hoses, etc. 3. Load truck with materials. Inspect the paint to be loaded to ensure it looks uniform and does not need to be stirred. 4. Optional: Perform wet film thickness tests – Paint over a flat surface (old sheet sign material works well) without using beads, but with the same vehicle speed and pressure planned to be used for the operation. Use wet film thickness gauge to check depth of wet paint on the flat surface. Record results on paint application form. Desired thickness is 15 mils. 5. Mobilize to job site. 6. Set up safety devices if needed and prep truck for painting operation 7. Within the first 4 miles of painting (8 miles if step 3 performed), pull off roadway on area of level ground to measure paint levels and calculate application rates. Record results on paint application form. Also inspect quality of line (width, thickness, bead coverage, bead embedment). 8. Make adjustments as necessary. 9. Resume painting operations continually listening to and watching the paint and bead guns. Pay close attention to the sound the paint gun is making. If there is a whistling noise, or the sound changes that is likely and indication something is amiss. If you here these noises or if gunners / back up drivers notice uneven coverage of paint / beads pull over as soon as possible to correct situation. 10. Flush paint guns as frequently as possible. Driver can alert gunner of upcoming intersections and roll through them to give time to flush the guns. 11. At the end of daily painting operations, flush all paint guns thoroughly to prevent paint hardening overnight. This will prevent time consuming cleaning before starting the next painting day. 12. Attach the paint application form to work order in WMS.

ACTIVITY	Ramp or Parking Lot Painting	CODE	8340
Work Method			
<p>Using Paint Truck:</p> <ol style="list-style-type: none"> 1. Visual inspections of paint guns, paint filters, air compressor. 2. Load truck with materials. This can also be performed at the end of the day. 3. Mobilize to job site. 4. Pull off of road, set up safety devices, prep truck for painting. 5. Paint approximately 1 mile, pull off road to check quality of line (width, thickness, and bead coverage) 6. Begin paint operations. 7. Backup drivers should be observing line and notify crew leader of any problems or concerns. (This includes traffic back ups or line quality issues) 8. At the end of painting operations, flush all paint lines and guns as needed. 9. Return to load site. <p>Using Portable Paint Machine:</p> <ol style="list-style-type: none"> 1. Visually inspect portable paint machine; look for obvious signs of wear or leaks. 2. Load material into paint machines at yard; insure to load enough extra paint and beads to complete project. 3. Set up any required safety devices. 4. Sweep or use blower to clean area of debris. 5. Layout stencils or line off areas to be painted. 6. Test application rate using a wet film gage. The ideal thickness is 15 mil. When using the gage, do not apply beads. 7. Paint the markings. 8. Remove any safety devices <p>Melted Thermoplastics:</p> <ol style="list-style-type: none"> 1. Visually inspect thermoplastic melter and applicator when used; looking for obvious signs of wear or leaks. 2. Load materials; insure enough material is on trailer or truck to complete days work. 3. Light melting pot and begin melting material while in route to jobsite. 4. Mobilize to jobsite. 5. Set up safety devices. 6. Prep equipment; set up portable applicator pot with appropriate applicator "shoes"; continue to melt the appropriate amount of material in melting pot. Material should be heated to a minimum of 385 and maximum of 450 degrees Fahrenheit. 7. Remove markings if necessary with grinder, and clean marking area with broom or blower to remove excess loose material. 8. Layout markings with stencils or line markings 9. Begin marking operations; insure all safety procedures are followed to insure accidental splashing does not occur. Do not drop blocks or bags of material into melting pot. Use material chutes, and let material slide into pot. Thermoplastic should be applied at 125 mil. Beads should be applied with bead bar located directly behind the application shoe. The beads are gravity applied. Throwing beads onto melted thermoplastic after the machine is finished is ineffective. The beads need to be applied as the thermoplastic hits the roadway, otherwise the beads will not achieve proper embedment depth. 10. At the end of the operation, ensure all thermoplastic shoes are emptied and cleaned. 11. Remove safety devices. 			
Special Considerations			
<p>Keep close eye on paint build up around paint guns and shrouds Consider night painting in high volume urban areas Consider weather forecast for chance of rain when scheduling paint crew</p>

ACTIVITY		Curb Painting		CODE	8350
Purpose				Category	Roadway/Drainage
To restore and maintain adequate visibility of curbs in communities, on ramps, and at rest parks.				<input type="checkbox"/> PM <input type="checkbox"/> QA <input type="checkbox"/> Unit Cost <input type="checkbox"/> Plan Location	
Scheduling & Coordination					
<p>Schedule this work during the warmer months.</p> <p>Schedule this painting as lines deteriorate or Engineering judgement. Typically not every year.</p> <p>Seasonal and temperature limitations for painting must be observed per paint manufacturer guidelines. Waterborne paints must be applied at 50 degrees ambient temperature or higher.</p> <p>All markings shall conform to the standards in the Manual on Uniform Traffic Control Devices.</p> <p>Consider weather forecast for chance of rain when scheduling paint crews</p>					
Reporting				Reporting Units	Linear Feet
<p>Accomplishment is the feet of painted curb.</p> <p>When painting top and side of curb on separate passes, it is still only 1 accomplishment per foot of curb.</p>

Sub Activities					
Average Daily Production		5,000 Linear Feet		EFFECTIVE DATE	July 1, 2013

ACTIVITY	Curb Painting	CODE	8350
-----------------	----------------------	-------------	-------------

Work Method

1. Visual inspections of paint guns, paint filters, air compressor, paint and bead lines; looking for obvious signs of leaks, clogged paint or bead shrouds, loose connections, or worn hoses.
2. Load truck with materials. This can also be performed at the end of the day.
3. Mobilize to job site.
4. Pull off of road, set up safety devices, prep truck for curb painting; lower carriage to prescribed height determined by the specific curb to be painted. Place safety chains or connect steel bars to carriage to prevent it from accidentally falling or moving during this operation. This will prevent damage to the carriage itself and the paint and bead guns. Position paint and bead guns to paint the desired curbs.
5. Begin paint operations. Drive slowly approximately 5 MPH or less to prevent damage to paint guns. Application rates should be the same as 4" painted lines; 16.5 gallons of paint per painted mile and 6 pounds of glass beads per gallon of paint.
6. Backup drivers should be observing painted curb and notify crew leader of any problems or concerns. (This includes traffic back ups or line quality issues)
7. At the end of painting operations, flush all paint guns as needed.
8. Return to load site.

Special Considerations

Keep close eye on paint build up around paint guns and shrouds.
 Consider night painting in high volume urban areas.
 Consider coordinating painting with special events in the communities.

ACTIVITY	Special Marking Maintenance	CODE	8360
<p>Work Method</p> <p>Work methods vary depending on material used.</p> <p>Melted thermoplastics:</p> <ol style="list-style-type: none">1. Visually inspect thermoplastic melter and applicator when used; looking for obvious signs of wear or leaks.2. Load materials; ensure enough material is on trailer or truck to complete days work.3. When using thermoplastic, light melting pot and begin melting material while in route to jobsite.4. Mobilize to job site.5. Set up safety devices.6. Prep equipment; set up portable applicator pot with appropriate applicator "shoes"; continue to melt the proper amount of material in melting pot. Material should be heated to a minimum of 385 and maximum of 450 degrees.7. Remove markings if necessary with grinder. Clean marking area with broom or blower removing loose material.8. Layout markings with stencils or line markings9. Begin marking operations; insure all safety procedures are followed to insure accidental spashing does not occur, do not drop blocks or bags of material into melting pot; use material chutes and let material slide into pot, thermoplastic should be applied at 125 mil. Beads should be applied with bead bar located directly behind the application shoe. The beads are gravity applied. Throwing beads onto melted thurmoplastic after the machine is finished is ineffective. The beads need to be applied as the material is applied to the roadway; a crust forms almost immediately and this prevents beads from being embedded to proper depth when thrown on afterwards.10. At the end of marking operations, ensure all thermoplastic shoes are emptied and clean.11. Remove safety devices <p>Pre-formed thermoplastic:</p> <ol style="list-style-type: none">1. Check propane torches prior to leaving yard; torches should be rated at 750 degrees in order to effectively melt the pre-formed plastic. Always carry extra propane tanks. Load enough material to perform scheduled work.2. Mobilize to job site; set up safety devices3. Sweep or use blower to clean area of debris4. Mark roadway, if necessary, and lay out pre-formed markings.5. Heat markings uniformly until plastic is fully melted and adhears to the pavement. Typically a small amount of bubbling will occur and the plastic will change colors slightly.6. Remove safety devices. <p>Cold applied tape:</p> <ol style="list-style-type: none">1. Load material; mobilize to job site.2. Sweep or use blower to clean area of debris3. Mark roadway, if necessary, apply activator (glue) to area and let it set up; apply tape and roll it with weighted roller per manufactures specification.4. Remove safety devices.			

ACTIVITY	Special Marking Maintenance - Cont'd	CODE	8360
----------	--------------------------------------	------	------

Waterborne paint:

1. Visually inspect portable paint machine; look for obvious signs of wear or leaks.
2. Load material into paint machines at yard; insure to load enough extra paint and beads to complete project.
3. Sweep or use blower to clean area of debris
4. Layout stencils or line off areas to be painted;
5. Paint markings; application rate is as close to the painted mile rates as possible using the portable machine. A wet film gage can be used to measure line thickness. Ideal thickness is 15 mil. When using this gage do not apply beads; this test should be used prior to markings application.
6. Remove safety devices

Special Considerations

Try to perform activity in warm months to allow use of block or bag thermoplastics or waterborne paint. Higher productivity rates can be achieved with these particular markings.

Pre-formed markings can be used in colder weather, but are more expensive and much less productivity can be expected.

When melting pot is on, consider having one crew member monitor pot at all times for safety.

COMM. #: _____
 INTERSECTION: _____
 CITY: _____ CONTRACT NO. _____
 COUNTY: _____
 TURN ON DATE: _____
 TURN ON TIME: _____
 CONTRACTOR: _____

APPROVED	REJECTED	CORRECTED	OVERHEAD INSTALLATION
			1) Signal Heads
			A) Adequate Clearance ___1) Mast arm, span / Catenary 17-19 ft. ___2) Pole (side mount) greater than 10'
			B) Drip loops proper on heads, splice boxes, pole weather heads.
			C) All electrical connections tight ___1) Heads ___2) Disconnects and splice boxes
			D) Seal installed where nipple goes into head
			E) Stranded wire #14 home run from splice box to heads
			F) Check for proper bulb size ___1) 12" Head- Reds & Arrows - Approved LED Green & Amber - Approved LED ___2) Pedestrian (all) LED insert
			G) Proper installation of span hanger and balance adjuster
			H) Check for proper instalation of LED Lenes. Check for warranty sticker on back of LED
			I) Tethered heads are tied down properly
			J) Pelco \ Louver programmed Heads - proper degree of tilt and angle
			K) Proper lane alignment Veh. And Peds/LED Heads
			L) Horizontal spacing - 12' desired, 8' min.
			M) Check for proper visors (standard, tunnel, louvered tunnel
			O) Proper distance to stop bar (40' minimum)
			2) Traffic Signal Signs
			A) Assure that all traffic signal signs are accounted for and placed in proper location
			B) Verify that all traffic signal signs have a proper renewal sticker on its respective back side

APPROVED	REJECTED	CORRECTED	POLES
			3) Poles
			A) Caps if required (top & over anchor bolts)
			B) All leveling nuts tight against base and all threads used on nuts
			C) Washer for leveling and anchor nuts
			D) Anchor nuts tight
			E) Proper grouting (Weep Holes 1") or pole base banding properly bolted
			F) Grounded properly, no splices
			G) Check for damaged wire in pole
			H) Splices in pole waterproofed
			I) Entrance Switch _____1) Fasten properly (4' above ground properly connected to poles, separate entrances for service and load) _____2) Grounded properly (no splices) _____3) Contains breaker (50 Amps) _____4) Insulation on wire not damaged _____5) Proper color code (White-nuet.) _____6) Sealed and Waterproofed _____7) Meter Base installed properly
			J) Conduit properly fasten to pole (less than 3' from terminus, coupling; 10' max. vertical spacing)
			L) Raked properly (steel-near vertical; wood-1') (Steel strain Poles no raking)
			M) Weather head looks proper (insert in)
			N) All locations where pole, mast arm, or hardware has field installations (welded nipples for entrance switch, weather head, etc.) shall have proper protective coating (2 Coats rust inhibiting aluminum paint)
			O) Pole access cover (handhole) installed and tight.

APPROVED	REJECTED	CORRECTED	SPAN AND CATENARY & CABINET
			4) Span and Catenary
			A) Check for proper tightness
			B) Proper no. of Crosby clamps @ "A" frames; must be clamped (not under the span hanger)
			C) Minimum of 2 rope clamps on aerial cables at poles and down guides
			D) Proper loops for cables at changes in alignment and taped properly
			E) Proper # of cable rings (12" C-C)
			F) Square plates for eye bolts through wood poles (intersection side)
			H) Down guide fastened to same eye bolt as span/catenary cable/Wire Rope in Saddles @ Pole Bands
			I) Check for Service clips
			J) Tether cable to heads fastened properly
			5) CABINET
			A) Placed such that one looking can observe intersection (traffic flow)
			B) Bolted down properly (washers)
			C) Grounded properly _____1) Ground wire connected to conduit and cabinet grounding lug using solid, unspliced copper wire NO SMALLER THAN # 6 _____2) All terminal block of cabinet grounded properly to ground rod _____3 Ground connection tagged with resistance in ohms
			D) Check cabinet wiring _____1) Loop lead-in to proper terminal and labeled _____2) Field wiring _____a) Confirm field wiring connected to proper signal head _____b) Connected to proper cabinet terminal _____c) Check color code _____3) Check for damaged field wire
			E) All electrical connections are tight
			F) All spade lugs & crimp on connections tight
			G) Foundation drain has screen and cap, check to see if foundation will drain properly
			H) Thermostat of fan set at (95-100 F)
			I) Fan is pulling air out of cabinet
			J) Proper literature and schematics in plastic pouch
			K) Clean filter in cabinet
			L) Cabinet clean and orderly fashion
			M) All scratches painted, unless stainless steel or aluminum
			N) Cabinet proper height, G-38" + 2" to bottom; "M", "P"- on raised foundation with step PAD

APPROVED	REJECTED	CORRECTED	CONTROLLER
			6) CONTROLLER
			I) General
			A) Check flash operation ___1) Police panel switch ___2) Preferentiality, controller code properly set
			B) Breaker operation ___1) Small breaker (10 amp) controller only, allows flash operation for controller replacement ___2) Large Breaker (50 amps) kills intersection
			C) Controller setup per authorized timing sheet
			D) Check heat lamp and 115 receptable
			E) Check interconnect color code. Fiber connected properly. Radio Modem Programed is applicable.
			F) Check time clock program as per sheet, if needed
			G) Check all heads in intersection for proper signal indications at proper time
			II) Interconnect
			A) Check interconnect communications (fiber/radio) operation of controller
			B) Check for proper operation of various functions, manual cycle 1,2,3,4 splits, and offsets
			C) Check key board for proper operation
			D) If no timing given for other than cycle 1 then place same timings in other cycles and splits for safety
			E) Check for proper fuse sizes ___1) Interconnect 5 Amps if required ___2) Auxiliary power 15 Amps
			F) Cabinet prints and any speciality panel prints present and correct.
			III) Actuated
			A) Check key board operation and ease of reading screen
			B) Observe traffic flow as it relates to controller operation
			C) Check & tune loop amps/check
			D) Check cabinet wiring schematic to assure loop identifications is consistent with phasing and signal field terminal identification is consistent with phasing as indicated elsewhere on print
			E) Check conflict card for proper jumpers
			F) If overlap card required check for proper jumpers, or proper dip switches are turned on
			G) Confirm loops are putting calls to: ___1) Proper loop amp ___2) Proper controller phase
			H) Check placement of load switched and flash relays, assure proper number

APPROVED	REJECTED	CORRECTED	CONTROLLER (Continued)
			I) Controller phases are operating respective signal heads per intersection phasing
			J) Conflict monitor set properly
			K) Use loop checker to check loops in proper range (50-1000 uH)
			Phase/Appr uH reading Phase/Appr uH reading
			L) Check Controller Warranty Sticker, if Applicable
			M) Check controller initialization, codes
			N) Check for proper programming of auxiliary functions, such as: Dual entry, SGO, pre-emption program, overlaps, Det. Call program, etc.
			O) Check coordination programs
			7) Handholes
			A) Proper lid and resting firmly
			B) Bushing on conduit
			C) Grouted where conduit enters handhole
			D) Drain in bottom
			E) Approximately 10' of slack in hole for each cable run
			F) Check conduit fill
			G) If splices present, then check waterproofing
			8) MK Housing
			A) 4 bolts and 4 washers present
			B) Splices waterproofed properly
			C) Small amount of slack present
			D) Check to see if loops wired in series
			9) Approved & Authorized Changed DWG
			If applicable, Approved and Authorized Changed Drawing (As-built) must be received by District Traffic Section

356 Removal			
Average Daily Production	0.22 - 1 Comm. No.	EFFECTIVE DATE	7/1/2013

ACTIVITY	Signal and Flasher Installation / Removal	CODE	8590
-----------------	--	-------------	-------------

Work Method

INSTALL

1. Place work area safety signs and devices
2. Install all items according to plans:
 Foundations hand holes and conduit, loops, structures, span cables, wiring and junction box, marking and signs, controller and cabinet, and signal heads.
3. Test that signal is functioning properly
4. Clean up work area
5. Remove work area safety signs and devices
6. Observe signal operation

REMOVAL

1. Place work area safety signals and devices
2. Remove all signal equipment and structures at intersection (ex. cabinet, poles, span wire, signal heads).
3. Clean up work area
4. Remove work area safety signs and devices

Special Considerations

Not recommended as winter activity to help prevent accidents. Drivers may take time recognize signal install / removal, and stop times are likely to be increased during the winter.

ACTIVITY	Gather Field Data	CODE	8920
-----------------	--------------------------	-------------	-------------

Work Method

Gather features inventory.

Various methods can be used including:GPS, Road Reference System, etc.

For Pavement Marking inspection:

1. Ensure retroreflectometer is fully charged, and calibrated prior to leaving the office.
2. Place any needed safety devices.
3. Pull vehicle full off road in a safe location.
4. Perform reflectivity readings in accordance with INDOT policies. Record readings and location.
5. Remove any safety devices.
6. Drive to next location, noting visual condition of markings along the way.

APPENDIX B

EXAMPLE CALCULATIONS
SWATH MILES OF MOWING

EXAMPLE 1

The average width of the right-of-way mowed is 15 feet.
The distance mowed is 1 mile.

By use of the chart the swath miles are determined to be:

1.0 mile @ average width 15 feet = 3.8 swath miles mowed
--

EXAMPLE 2

The average width of the right-of-way mowed is 40 feet.
The distance mowed is 2.7 miles.

By use of the chart the swath miles are determined to be:

2.0 miles @ average width 40 feet = 20.0 swath miles mowed
0.7 miles @ average width 40 feet = 7.0 swath miles mowed
Total 27.0 swath miles mowed

EXAMPLE 3

The average width of the right-of-way mowed is 18 feet.
The distance mowed is 7.8 miles.

By use of the chart the swath miles are determined to be:

7.0 miles @ average width 16 feet = 28.0 swath miles mowed
0.8 miles @ average width 16 feet = 3.2 swath miles mowed
7.0 miles @ average width 3 feet = 5.3 swath miles mowed
0.8 miles @ average width 3 feet = 0.6 swath miles mowed
Total 37.1 swath miles mowed

Appendix C

EXAMPLE CALCULATIONS
ACRES

EXAMPLE 1

The average width of the right-of-way sprayed is 30 feet. The distance sprayed is 1 mile.

By use of the chart acreage sprayed is determined to be:

1.0 mile @ average width 30 feet = 3.6 acres sprayed
--

EXAMPLE 2

The average width of the right-of-way sprayed is 40 feet. The distance is 2.7 miles.

By use of the acreage sprayed is determined to be:

2.0 miles @ average width 40 feet = 9.7 acres sprayed
0.7 miles @ average width 40 feet = 3.4 acres sprayed
Total 13.1 acres sprayed

EXAMPLE 3

The average width of the right-of-way sprayed is 35 feet. The distance mowed is 7.8 miles

By use of the chart acreage sprayed is determined to be:

7.0 miles @ average width 30 feet = 25.5 acres sprayed
0.8 miles @ average width 30 feet = 2.9 acres sprayed
7.0 miles @ average width 5 feet = 4.2 acres sprayed
0.8 miles @ average width 5 feet = 0.5 acres sprayed
Total 33.1 acres sprayed

ABBREVIATIONS

in = inches	sq = square	mm = millimeters
ft = feet	cu = cubic	cm = centimeters
yd = yards		m = meters
sta = stations (100 feet)		km = kilometers
ac = acres		ha = hectare
mi = miles		ml = milliliters
oz = ounces		l = liters
lb = pounds		kl = kiloliters
hund wt = hundred weight		mg = milligrams
t = short tons		cg = centigrams
pt = pints		g = grams
qt = quart		kg = kilograms (kilos)
gal = gallon		mt = metric tons
bar = barrel		°C = Celsius
F= Fahrenheit		°K = Kelvin

TEMPERATURE CONVERSIONS

To convert degrees Fahrenheit to degrees Celsius, use this formula:

$$\text{°Fahrenheit minus 32, times 5, divided by 9} = \text{degrees Celsius}$$

EXAMPLE 68 °F - 32 = 36 x 5 = 180, 180/9 = 20 °C (Celsius)

To convert degrees Celsius to degrees Fahrenheit, use this formula:

$$\text{°Celsius time 9, divided by 5, plus 32} = \text{Fahrenheit}$$

Example: 20° C x 9 = 180, 180/5 = 36, + 32 = 68 °F
