**Myth #1:** Naloxone encourages substance users to take more drugs.

**FACT:** Research has shown that naloxone does not lead to more drug use or riskier drug use. In fact, some studies have shown that naloxone results in a decreased use of opioids. Naloxone also causes opioid withdrawal symptoms, which is an effective abuse deterrent.

**Myth #2:** Naloxone prevents substance users from seeking treatment.

**FACT:** There is no evidence to support that naloxone prevents substance users from entering a treatment program. In fact, the near-death experience often serves as a catalyst to seeking treatment and maintaining recovery.

**Myth #3:** Naloxone makes people violent.

**FACT:** One of the most common side effects of naloxone administration in patients is confusion and disorientation. It is rare for someone to wake up from an overdose and become combative. This is especially rare if naloxone is administered by someone they know and trust.

**Myth #4:** Only doctors can prescribe naloxone.

**FACT:** The Indiana State Health Commissioner issued a standing order in 2016 that allows anyone to go directly to a pharmacy and purchase naloxone without having to obtain a prescription from their doctor.

**Myth #5:** Naloxone is taking too much of the public's funds and attention.

**FACT:** Every medical and emergency service has an associated cost. Substance use disorder and overdose is a recognized health condition that deserves attention. In 2017, more than 72,000 Americans died from a drug overdose. Many of these deaths could have been prevented by naloxone.

**Myth #6:** First responders administer naloxone to the same people over and over again.

**FACT:** Research has shown that the majority of overdose patients do not have repeated overdose events. Even so, public health officials believe that every life is worth saving, even if that requires repeated administration of naloxone to the same patient.
