COVID-19 Guidance for out-of-hospital mitigation strategies

Strategies to reduce the spread of infection in facilities with a patient/resident with a confirmed or suspected case of COVID-19:

GENERAL GUIDANCE

The following is guidance for out of hospital facilities who house patients with a confirmed or suspected case of COVID-19. There are a few guiding principles:

1. Placement of patient/resident in contact-droplet precautions with proper PPE - gown, glove, mask with face shield or eye protection
2. Proper donning and doffing of personal protection equipment when in contact with COVID-19 residents
3. Reduce the number of non-essential staff who come into contact with the patient/resident
4. Reduce the movement of staff between patients with and without COVID-19 –
   o cohort staff and patients in one area of the building if possible
   o cohort equipment for these patients/residents to limit spread of infection
5. Perform hand hygiene frequently before and after patient/resident contact, before clean/aseptic procedures, and after body fluid risk exposure, before and after coming on duty, and when hands are visibly soiled.

PPE GUIDANCE

Facilities should follow the CDC guidelines for health care workers and positive protective equipment:

Secondary to limited PPE availability facilities should use fit tested N95 masks only in essential staff who do procedures that are likely to generate respiratory aerosols (e.g., nebulizer treatments, COVID-19 testing), which would pose the highest exposure risk to the staff.

- Should N95 masks not be available the staff should wear a tight fitting surgical mask with no gaps around the face and eye-protection as in goggles (not just eye glasses) or face shield.

Those who do not do procedures which generate respiratory aerosols (e.g., insulin injections, medication delivery, lab draw, x-rays, and wound care) do not need N95 respirators at this time. These staff should wear eye protection, gown, gloves, and standard surgical facemasks to prevent droplet exposure.

- If there are shortages of isolation gowns, they should be prioritized for aerosol-generating procedures, care activities where splashes and sprays are anticipated, and high-contact patient care activities that provide opportunities for transfer of pathogens to the hands and clothing of essential staff
- Encourage staff to have a change of clothing on hand to change before leaving work and remember to perform hand hygiene after removal of uniforms and before leaving work for the day.

STAFFING RECOMMENDATIONS

Non-essential staff are considered those staff who come into contact with patients/residents, or patient/resident rooms, but do not provide medical care:

- Ancillary staff
To reduce the interaction between non-essential staff and COVID-19 patients, facilities should develop plans to shift duties from these staff to essential staff.

- **ONLY ESSENTIAL staff should go into the room of a confirmed or presumed COVID-19 patient.**

Essential staff are considered those staff who come into contact with patient/resident and provide medical care:

- Certified Nurse Assistants (CNAs)
- Qualified Medical Assistants (QMAs)
- Nurses
- Paramedics: Paramedics, donning appropriate PPE, are to be allowed into facilities to assess and transport patients to hospitals.
- X-ray staff: Those who come in to do emergency radiographs should don appropriate PPE and follow contact-droplet precautions.
- Laboratory staff:
  - If the essential staff at the facility can draw blood, the facility should work with their local laboratory to develop a protocol by which the facility staff draw the blood.
  - If essential staff at the facility cannot draw blood the laboratory staff should follow contact-droplet precautions.

To reduce essential staff who care for confirmed, or presumed, COVID-19 patients from interacting with patients ISDH recommends the following:

- Appropriate infection control measures with hand hygiene and contact-droplet precautions
  - https://www.cdc.gov/infectioncontrol/basics/transmission-based-precautions.html
- Appropriate donning and doffing of PPE – video training can be watched here
- Contract essential staff who recently cared for a COVID-19 confirmed, or presumed positive, patient/resident should, if possible, provide care at only one facility.
- Contract essential staff who care for confirmed, or presumptive positive, COVID-19 patients/residents should restrict their movements in facilities to those areas where the patient/resident resides.
  - Recommendation is to avoid working in other areas of the facility (e.g., going between assisted living and extended care facilities).
- To conserve PPE and N95 masks, limit the essential staff who perform testing or procedures that generate respiratory aerosols (e.g., suctioning, respiratory treatments). This can be done by identifying only one person who will do these procedures per shift.

**FACILITY GUIDANCE**

Included are considerations for designating entire units within the facility, with dedicated HCP, to care for known or suspected COVID-19 patients/resident and options for extended use of respirators, facemasks, and eye protection on such units.

Updated recommendations regarding need for an airborne infection isolation room (AIIR):

- Patients/residents with known or suspected COVID-19 should be cared for in a single-person (private) room with the door closed.
- Patients/residents with known or suspected COVID-19 should not share bathrooms with other patients/residents.
- All patients/residents returning from the hospital with suspected or confirmed COVID-19 should be cared for in a private room.
- Patients with close contact with a confirmed COVID-19 patient (e.g., roommate or infected staff without wearing PPE) should be isolated and follow 14 day self-monitoring guidelines outline by CDC.

**GUIDANCE FOR MEDICAL DIRECTORS**

Thank you for caring for vulnerable populations during this pandemic. To prevent the number of staff who come in contact with a confirmed or presumed COVID-19 patient at your facility please follow some simple guidance:

- Do not order non-urgent labs or x-rays. Refrain from ordering labs and x-rays that are to follow the long-term course of a disease (e.g., hemoglobin A1C, routine chemistries, Chest X-rays for pulmonary lesion progression).
- Consider alternatives to treatments to generate respiratory aerosols (e.g., inhalers vs nebulizers).
CMS – 1135 authority – Immediate jeopardy duties only and LTC Strike Teams

With CMS using 1135 authority to require nursing home surveyors to limit their duties to immediate jeopardy only, we will be using this workforce to form LTC strike teams. These teams will go to facilities (those with a presumed case will be prioritized) to do PPE training and communicate risk mitigation strategies with essential staff (those who provide healthcare to patients with presumed or confirmed COVID-19 cases). These teams will also do targeted test collection. We hope to fully utilize this workforce and their expertise to assure that the facilities that care for our most vulnerable residents are as prepared as possible to continue to do so safe and effectively. This is not a regulatory visit and there will be no report given to the facility. The team will rely upon the facility’s screening of the residents to prioritize testing. Please have a nurse available to assist with the resident during the testing. Your staff will be appreciated by both the resident and the strike team staff to comfort the resident.
