Indiana Lesbian, Gay, Bisexual, and Transgender Communities and Tobacco Use

Tobacco use is the single most preventable cause of death and disease in the United States. Annually, tobacco use causes more deaths than alcohol, AIDS, car accidents, illegal drugs, murders and suicides, combined. The impact of tobacco on Indiana is staggering, causing approximately 11,100 deaths annually. Research indicates that both nationally and in Indiana, tobacco use is higher among lesbian, gay, bisexual, and transgender (LGBT) individuals compared with the general population, substantially affecting the health of LGBT communities.\(^1\),\(^2\)

**Current Smoking among Lesbian, Gay, and Bisexual Adults – United States**

- Historically, there has been little research on the health of LGBT individuals nationwide.
- National Health Interview Survey (NHIS) data indicate that lesbian, gay and bisexual (LGB) adults are significantly more likely to currently smoke cigarettes than straight adults.\(^1\)

| Prevalence of current smoking among adults ages 18-64 in the U.S., NHIS 2013\(^1\) |
|---------------------------------|-----------------|-----------------|-----------------|
| Both sexes                     | Lesbian or Gay  | Bisexual        | Straight        |
| Males                          | 27.2%\(^\dagger\) | 29.5%\(^\dagger\) | 19.6%           |
| Females                        | 27.2%\(^\dagger\) | 29.4%\(^\dagger\) | 16.9%           |

\(^{\dagger}\)Significantly higher than among straight individuals. No data are available for transgender individuals.

**Current Smoking among Lesbian, Gay, and Bisexual Adults - Indiana**

- Indiana Behavioral Risk Factor Surveillance System (BRFSS) data indicate that in 2014 lesbian or gay adults were over two times more likely to currently smoke cigarettes than straight adults.
- For both sexes combined, bisexual individuals were nearly 50% more likely to smoke cigarettes than straight individuals.
- Over half (50.6%) of gay men currently smoke, compared with 24.3% of straight men.
- A higher proportion of lesbian or gay women (43.4%) and bisexual women (37.4%) report smoking compared with straight women (20.7%).

**Prevalence of current smoking among Indiana adults by sexual orientation, BRFSS 2014\(^2\)**

![Graph showing prevalence of smoking among Indiana adults by sexual orientation](image)

\(^{\ast}\)Data for transgender individuals and bisexual males are suppressed due to insufficiently reliable estimates. Due to differences in data collection methodology, Indiana estimates are not directly comparable to U.S. estimates presented in this fact sheet.

Current Smoking among Indiana LGB Adults, by Age

- Although lesbian and gay adults across age groups smoked at higher rates than straight adults in 2014, younger lesbian and gay adults (ages 18-49) smoked at higher rates than older lesbian and gay adults. Notably, over half (52%) of lesbian and gay adults ages 18-49 report being current smokers.
- Bisexual adults ages 18-49 also smoked at higher rates (37.3%) than straight adults (27.0%).

E-Cigarette Use

Indiana Adult Tobacco Survey (IATS) data indicate that in 2015 LGBT** individuals were significantly more likely than straight individuals to have ever tried electronic cigarettes (e-cigarettes) (46.5% vs. 16.4%, respectively). E-cigarettes are being promoted as a less dangerous alternative to cigarettes or smoking cessation aid; however, e-cigarettes have not been approved as safe by the U.S. Food and Drug Administration (FDA). The FDA has warned the public that e-cigarettes may contain various toxic chemicals.

Smoking Cessation

An estimated 43.4% of LGBT** adult smokers in Indiana report not intending to quit at any point in the future compared with 27.8% of straight adult smokers.

Factors Contributing to Tobacco Use Disparities among LGBT Populations

A number of factors may contribute to the higher prevalence of tobacco use among LGBT communities, including:
- Direct targeting by tobacco companies, including direct and indirect media advertising and sponsorship of LGBT events
- Discrimination, violence, and stress experienced by LGBT communities
- Barriers to accessing health care and cessation treatment services
- Higher prevalence of risk factors such as alienation, low self-esteem, and depression among LGB youth.

Resources for Quitting Tobacco Use

Tobacco users should contact a health care provider for assistance and call 1-800-Quit-Now or visit www.QuitNowIndiana.com for free, evidence-based support, advice and resources.
