FOREWORD

This bulletin discusses recent Indiana forest industry trends and contains the results of a detailed study of the forest industry, industrial roundwood production, and associated primary mill wood and bark residue in Indiana in 1990. Such detailed information is necessary for intelligent planning and decisionmaking in wood procurement, forest resource management, and forest industry development. Likewise, researchers need current forest industry and industrial roundwood information for planning projects.

Special thanks are given to the primary wood-using firms that supplied information for this study and to Gary U. Gretter and Glenn T. Durham, foresters for the Indiana Department of Natural Resources, who canvassed these respondents. Their cooperation is greatly appreciated.

All references to red oak in this paper are for the red oak group, which includes black oak as well as northern red oak, cherrybark oak, shumard oak, scarlet oak, southern red oak, shingle oak, and pin oak. Similarly, all references to white oak are for the white oak group, which includes white oak, swamp white oak, bur oak, swamp chestnut oak, chinkapin oak, chestnut oak, and post oak.

All board feet data in this report have been converted to International 1/4-inch scale by applying a multiplier of 1.38 to all saw-log and handle-bolt volumes reported by sawmills and handle mills in Doyle scale and a multiplier of 1.14 to all veneer log and cooperage log volumes reported in Doyle scale by veneer and cooperage mills. To convert to Doyle log scale, multiply the International scale volume for saw logs and handle bolts by 0.7246 and multiply the International scale volume for veneer logs and cooperage logs by 0.8772.

The last report from a detailed study of all industrial roundwood output in Indiana was published in 1984. Most comparisons in this report are with the 1984 study results. Quantities shown may vary slightly from one table to another because of rounding differences, but these differences are insignificant.

Indiana Timber Industry—An Assessment of Timber Product Output and Use, 1990

Ronald L. Hackett and Robert W. Mayer

HIGHLIGHTS

PRIMARY TIMBER INDUSTRY—INDUSTRIAL ROUNDWOOD

- Industrial roundwood production rose from 65.6 million cubic feet in 1984 to 80.1 million cubic feet in 1990. Annual production increased 4 percent for hardwoods and declined 17 percent for softwoods.
- Saw logs accounted for more than 90 percent of the industrial roundwood production in 1990.
- In 1990, 76 percent of the total growing stock harvested came from red oak, white oak, yellow-poplar, ash, and hickory.

- Log and bolt receipts at primary mills were 507 million board feet (International 1/4-inch scale). Hardwood receipts increased 30 percent and softwood receipts declined 52 percent since 1984.
- Total material harvested from timberland for industrial roundwood (excluding residential fuelwood) was 143 million cubic feet. Growing stock accounted for 67 percent (96 million cubic feet) of this total.

In 1990, 277 primary wood-using mills were operating in Indiana. Sawmills dominate Indiana's forest industry in terms of volume of wood used. Indiana's production of industrial roundwood is reported by the four Forest Survey Units (fig. 1).

SAW LOGS

Ronald L. Hackett, Research Forester, received a B.S. in forest resources from the University of Minnesota. He joined the Forest Service in December 1974 and has been working with the North Central Station's Forest Inventory and Analysis Unit since.

Robert W. Mayer, Forest Products Utilization and Marketing Supervisor, received a B.S. in biology/chemistry from Oakland University and an M.S. in forest management from Michigan State University. He joined the Indiana Division of Forestry in 1977 and assumed his present position in 1988.

- Loggers cut nearly 436 million board feet (International 1/4-inch scale) of Indiana saw logs in 1990, up 23 percent (82 million board feet) since 1984. Nearly 33 percent of the 1990 production was accounted for by species in the red oak group.
- Major saw-log species harvested in 1990 were red oak, yellow-poplar, white oak, and ash. Hickory and beech were the only species that had major declines in production between 1984 and 1990 with 5 and 4 million board feet, respectively (fig. 2).

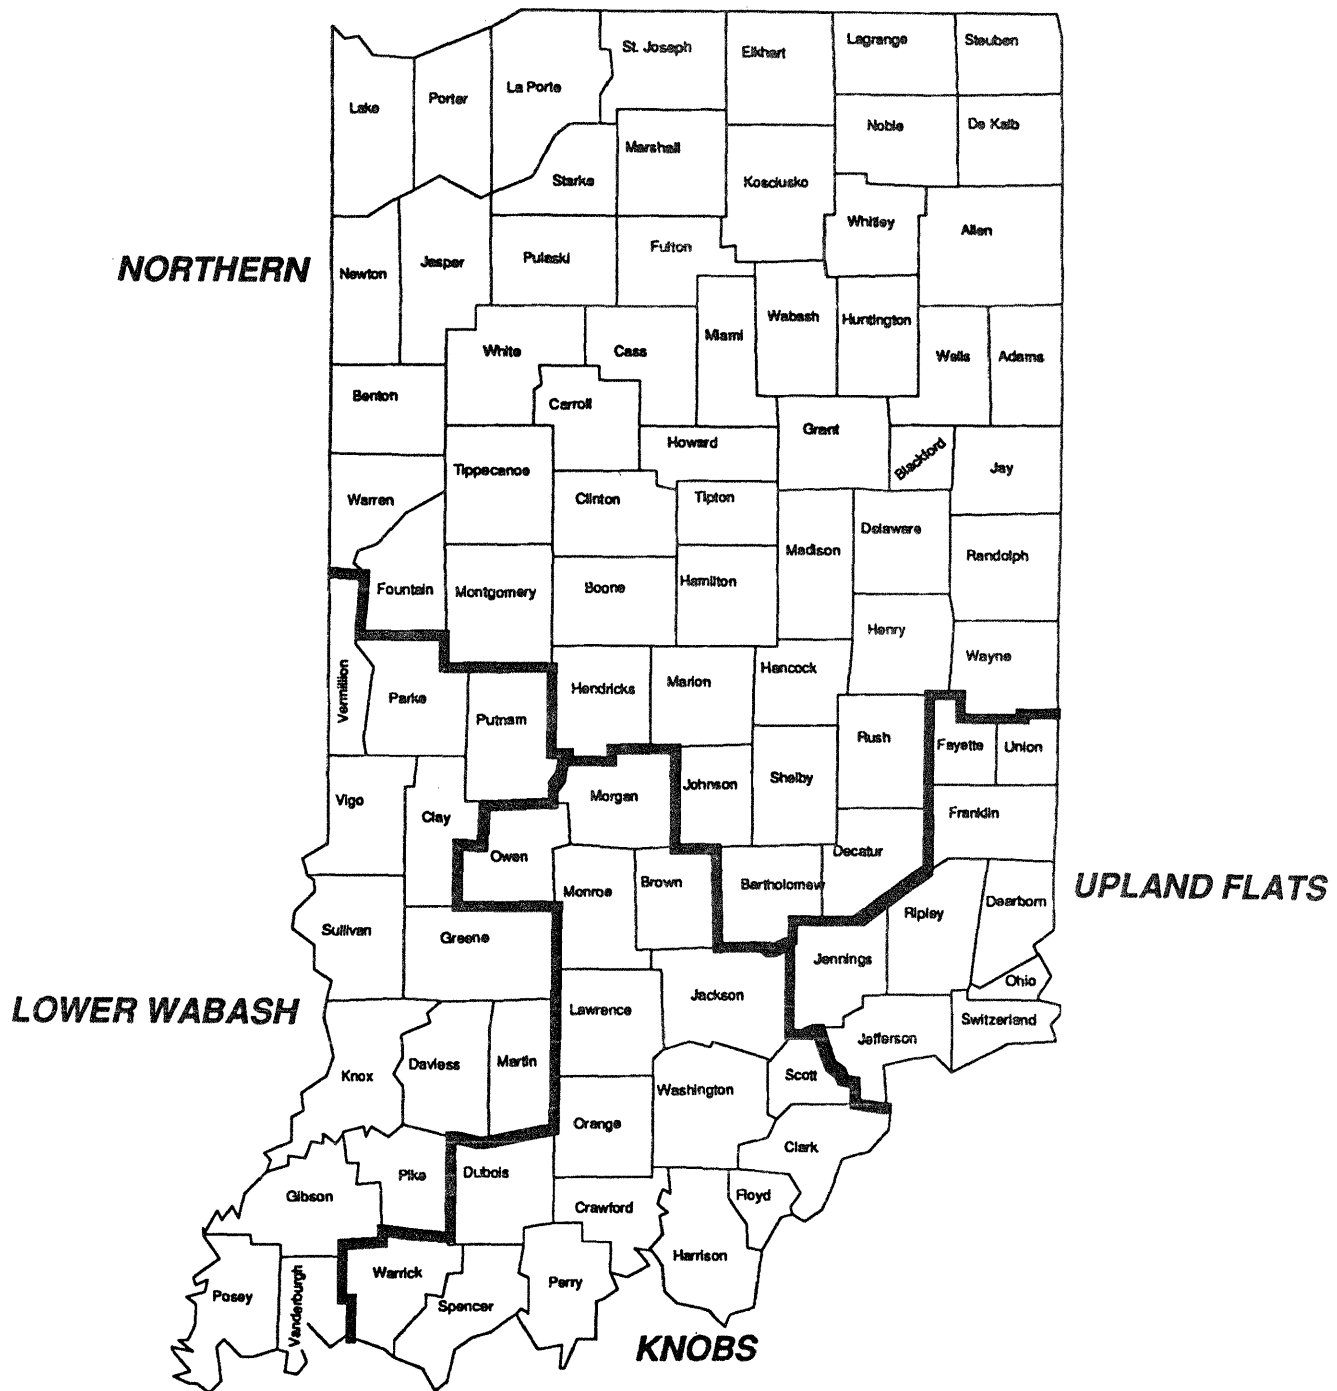

Figure 1.—Forest Survey Units in Indiana.

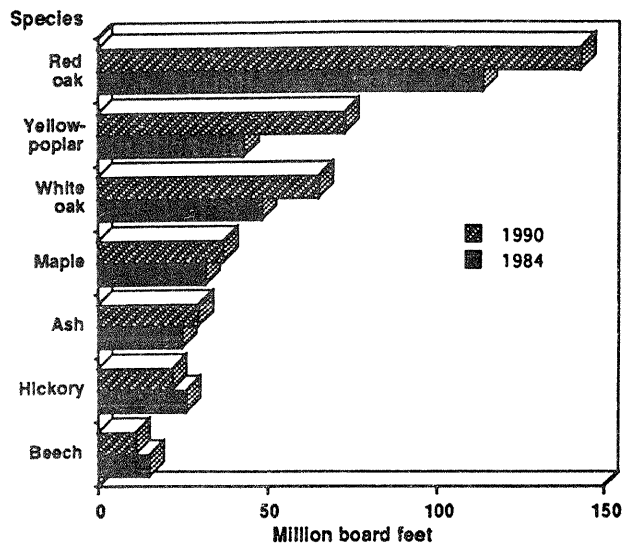

Figure 2.—Saw-log production in Indiana by selected species group, 1984 and 1990.

- Saw-log production was highest in the Knobs Unit of Indiana with 204 million board feet or 47 percent of total production for 1990. The Northern and Lower Wabash Units together produced another 46 percent of the total saw logs cut in Indiana.
- One percent of the saw-log volume—primarily red oak, cottonwood, and white oak—was shipped to Illinois, Ohio, Michigan, and other States outside the region.
- In 1990, 246 active sawmills in Indiana received 506.8 million board feet of saw logs; in 1984, 276 sawmills received 391 million board feet.
- Indiana imported a total of nearly 75 million board feet of saw logs from Illinois, Michigan, Kentucky, Ohio, Iowa, and other States. Major imported species were red oak, white oak, black oak, and yellow-poplar.

PULPWOOD

- Indiana produced 189 thousand cords of pulpwood, including mill residues, in 1990. This volume was 8 percent lower than the 1984 production of 206 thousand cords. Pulpwood includes all fiber-based products made from roundwood, including paper, particleboard, oriented strand board (OSB), and waferboard.

- Hardwood residues comprise 79 percent of the pulpwood production in Indiana (fig. 3). Roundwood pulpwood constitutes 4 percent of the industrial roundwood harvested in the State.

Figure 3.—Pulpwood by species group and residue production for Indiana, 1990.

- Sixty-eight percent of the roundwood pulpwood was harvested in the Knobs Unit, and the rest was harvested in the Lower Wabash Unit. Principal species cut in 1990 for pulpwood were hickory, red oak, white oak, hard maple, and cottonwood.
- In addition to the one pulpwood mill operating in the State, Indiana supplied pulpwood mills in Wisconsin, Michigan, Kentucky, and Ohio.

VENEER LOGS

- Loggers cut 16.8 million board feet of Indiana veneer logs in 1990, 18 percent more than in 1984.
- Of the 16.8 million board feet of veneer logs cut in 1990 in Indiana, 73 percent remained in the State, and 18 percent was exported to Ohio. The other 9 percent was exported to other States and countries.

- White oak was the primary veneer species cut in Indiana in 1990, followed by black walnut, red oak, hard maple, and yellow-poplar (fig. 4). White oak and black walnut were the main species exported from Indiana to Ohio and other countries, principally Japan and Germany.

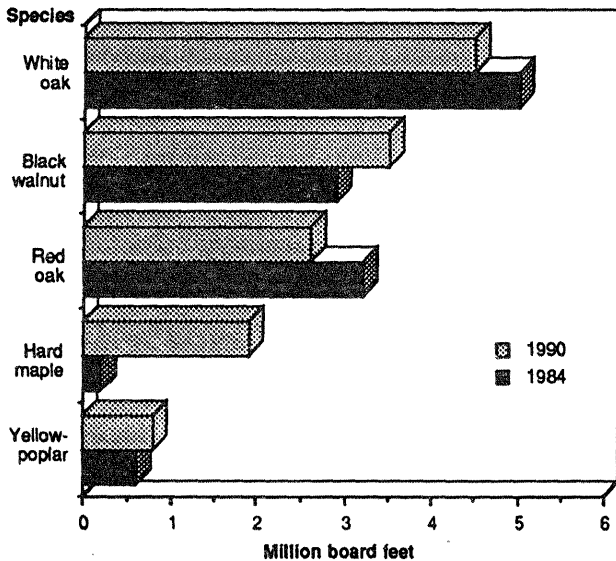

Figure 4.—Veneer log and bolt production by selected species groups for 1984 and 1990, Indiana.

- Fourteen Indiana veneer mills received almost 35 million board feet of logs and bolts. Imports totaled 22.6 million board feet from surrounding States and other States outside the region. Five States contributed more than 2 million board feet each of veneer logs and bolts: Pennsylvania, Kentucky, Michigan, Ohio, and Illinois.
- White oak was the major species processed in Indiana, followed by black walnut, black cherry, red oak, and hard maple. Kentucky and Illinois provided 54 percent of the white oak processed in Indiana in 1990. Kentucky and Ohio were the primary sources of black walnut. Pennsylvania furnished 90 percent of the black cherry and 60 percent of the red oak processed in veneer mills in Indiana. Michigan provided 77 percent of the hard maple used for veneer in Indiana.

OTHER PRODUCTS

- Loggers cut 2.2 million cubic feet of other industrial roundwood products in Indiana in 1990. These products include handle bolts, cooperage logs, shaving bolts, and excelsior bolts, etc.
- Handle-bolt harvesting occurred throughout the State, and ash supplied most of the 6.8 million board feet produced.
- Cooperage log production (5.2 million board feet) was all from white oak, and more than 80 percent was cut in the Knobs Unit.

HARVEST RESIDUE

- During 1990, loggers in Indiana left an estimated 63 million cubic feet of unused wood material on harvested timberlands.
- Red oak, yellow-poplar, white oak, and black oak species groups accounted for 65 percent of all unused wood left after harvesting (harvest residue).
- Logging residue accounted for 21.5 million cubic feet, while logging slash totaled 41.5 million cubic feet.
- Production of harvest residues by Survey Units was:

Survey Unit	Residue volume	
	(Million cubic feet)	(Percent of total)
Lower Wabash	13.7	22
Knobs	29.5	47
Upland Flats	5.0	8
Northern	14.8	23
Total	63.0	100

PRIMARY MILL RESIDUE

- During 1990, Indiana primary wood-using mills (except the pulpmill) generated 730 thousand green tons of coarse residue, 462 thousand green tons of fine residue, and 323 thousand tons of bark.
- More than 80 percent of each residue class (coarse, fine, and bark) generated at Indiana mills was used.

- Pulpwood mills consumed 57 percent of the coarse residue for fiber products, and industry and households consumed 34 percent for fuel.
- Fine residue and bark were used primarily for industrial fuel and soil conditioner, mulch, livestock bedding, and poultry litter.

TIMBER REMOVALS

- In the production of industrial roundwood, 95.9 million cubic feet of growing stock was removed from the timberland in 1990.
- Major species harvested in both growing stock and sawtimber were red oak, white oak, yellow-poplar, and ash.
- In the production of industrial roundwood, 142.9 million cubic feet of timber was cut. Close to half of this total was left in the woods as harvest residue (fig. 5).

- Logging residue accounted for 15 percent or 21.5 million cubic feet of industrial roundwood harvested in Indiana in 1990. Logging slash accounted for 29 percent or 41.5 million cubic feet of material.

Figure 5.—Distribution of material from harvested timberland for industrial roundwood in Indiana, 1990.

APPENDIX

STUDY METHODS

Data for this publication came from responses to a mail questionnaire (see following pages) sent to all known veneer mills, specialty mills (poles, piling, etc.), and all Indiana primary sawmills that processed logs and bolts in 1990.

The study was a cooperative effort of the Indiana Department of Natural Resources (IDNR) and the North Central Forest Experiment Station (NCFES). All canvassing in Indiana was done by the IDNR using mail and personal contacts; followup of nonrespondents was by mail, telephone, and personal contacts. IDNR utilization and marketing specialists provided estimates based on prior knowledge and contacts for a few Indiana mills that did not furnish complete data.

The NCFES mailed a questionnaire to all pulp mills and all out-of-State mills using Indiana roundwood. Followup of nonrespondents was by mail and telephone.

Logging utilization factors were used to estimate the logging residue. These factors were determined from earlier Illinois logging utilization studies by the NCFES during 1984 and 1985. The logging utilization study determines how much of the tree the logger takes for primary timber products and how much of the tree is left at the logging site. This does not account for any secondary wood processors who come in and take other products from the tree such as pulpwood or fuelwood.

The NCFES edited and compiled the data.

LOGS AND OTHER WOOD PROCESSED IN 1990

INDIANA

This form is for reporting the quantities and kinds of logs and other wood processed by this plant in 1990, and the disposition of the wood residues resulting from this operation.

All replies will be held confidential and used only for statistical reports.

Forest Survey Units in Indiana

DEFINITION OF TERMS

- Coarse mill residue.**—Wood residue suitable for chipping such as slabs, edging, and veneer cores.
- Consumption.**—The quantity of a commodity, such as saw logs, utilized.
- Fine mill residue.**—Wood residue not suitable for chipping such as sawdust and veneer clippings.
- Forest Survey Unit.**—A geographic area (group of counties) used by the Forest Inventory and Analysis Project to report periodic inventories and use of forest resources.
- Harvest residues.**—The total unused wood material left after harvesting.
- Industrial roundwood products.**—Saw logs, pulpwood, veneer logs, poles, commercial posts, piling, cooperage logs, particleboard bolts, shaving bolts, lath bolts, charcoal bolts, and chips from roundwood used for pulp or board products.
- Industrial roundwood production.**—The quantity of industrial roundwood harvested in a geographic area.
- Industrial roundwood receipts.**—The quantity of industrial roundwood received by commercial mills.
- Logging residue.**—The unused portions of merchantable trees cut or killed and left by logging.
- Logging slash.**—The unused portion of unmerchantable trees or unmerchantable portion (limbs, tops) of merchantable trees cut or killed and left by logging.
- Primary wood-using mills.**—Mills receiving roundwood or chips from roundwood for processing into products.
- Primary wood-using mill residue.**—Wood materials (coarse and fine) and bark generated at manufacturing plants from roundwood processed into principal products. These residues include wood products

(byproducts) obtained incidental to production of principal products and wood materials not utilized for some product.

Roundwood.—Logs, bolts, or other round sections cut from trees (including chips from roundwood).

Standard cord.—A stack of wood bolts (or the equivalent) encompassing 128 cubic feet of wood, bark, and air space. A cord of pulpwood in the North Central Region is assumed to contain 79 cubic feet of wood and 49 cubic feet of bark and air space.

Timberland.—Forest land producing or capable of producing crops of industrial wood and not withdrawn from timber utilization by statute or administrative regulation. Generally, this includes areas suitable for growing crops of industrial wood in excess of 20 cubic feet per acre annually.

Veneer log.—A log considered suitable in size and quality for producing veneer-sliced or rotary-cut.

COMMON AND SCIENTIFIC NAMES OF TREE SPECIES MENTIONED IN THIS REPORT

SOFTWOODS

Pine	
Shortleaf pine	<i>Pinus echinata</i>
Virginia pine	<i>Pinus virginiana</i>
Eastern white pine	<i>Pinus strobus</i>
Red pine	<i>Pinus resinosa</i>
Scotch pine	<i>Pinus sylvestris</i>
Cypress	<i>Taxodium distichum</i>
Eastern redcedar	<i>Juniperus virginiana</i>

HARDWOODS

White oak	
White oak	<i>Quercus alba</i>
Swamp white oak	<i>Quercus bicolor</i>
Bur oak	<i>Quercus macrocarpa</i>
Swamp chestnut oak	<i>Quercus michauxii</i>
Chinkapin oak	<i>Quercus muehlenbergii</i>
Chestnut oak	<i>Quercus prinus</i>
Post oak	<i>Quercus stellata</i>
Red oak	
Northern red oak	<i>Quercus rubra</i>
Cherrybark oak	<i>Quercus falcata</i> var. <i>pagodaefolia</i>
Shumard oak	<i>Quercus shumardii</i>
Black oak	<i>Quercus velutina</i>
Scarlet oak	<i>Quercus cocctnea</i>

3/ Livestock bedding, mulch, small dimension, and specialty items.

Hackett, Ronald L.; Mayer, Robert W.

1993. **Indiana timber industry—an assessment of timber product output and use, 1990.** Resour. Bull. NC-146. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 35 p.

Discusses recent Indiana forest industry trends; production and receipts of pulpwood, saw logs, and veneer logs; and production of other timber products in 1990. Reports on harvest residue, on wood and bark residue generated at primary wood-using mills, and on disposition of this mill residue.

KEY WORDS: Pulpwood, saw logs, veneer logs, residue.
